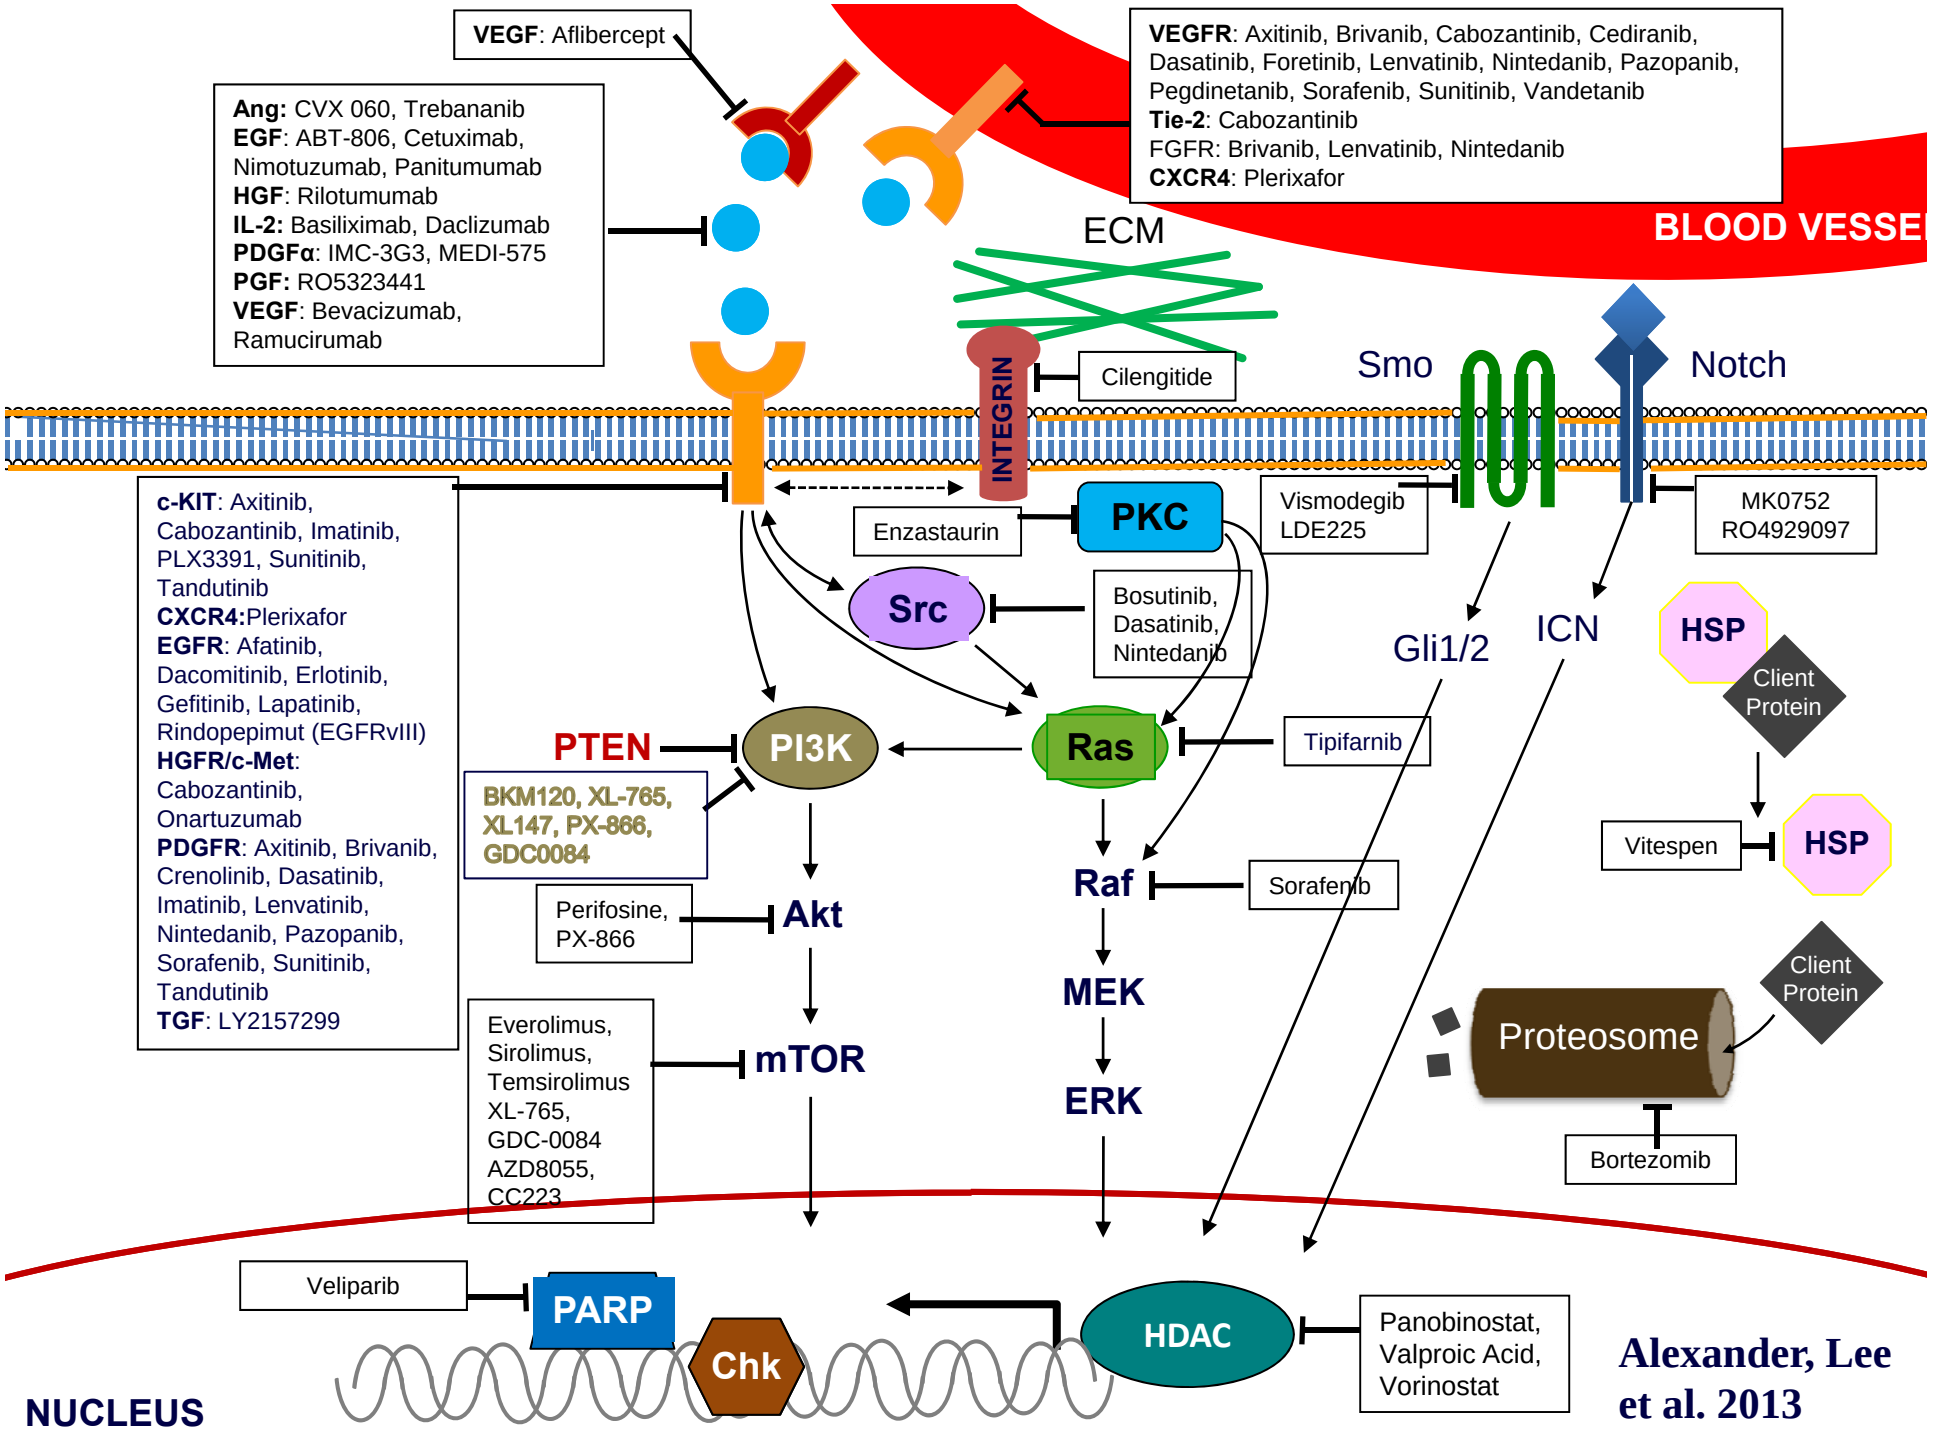
TIME

THERE IS NEW AMMUNITION IN THE WAR AGAINST CANCER. THESE ARE THE BULLETS.

Revolutionary new pills like GLEEVEC combat cancer by targeting only the diseased cells. Is this the breakthrough we've been waiting for?



VEGF: Aflibercept

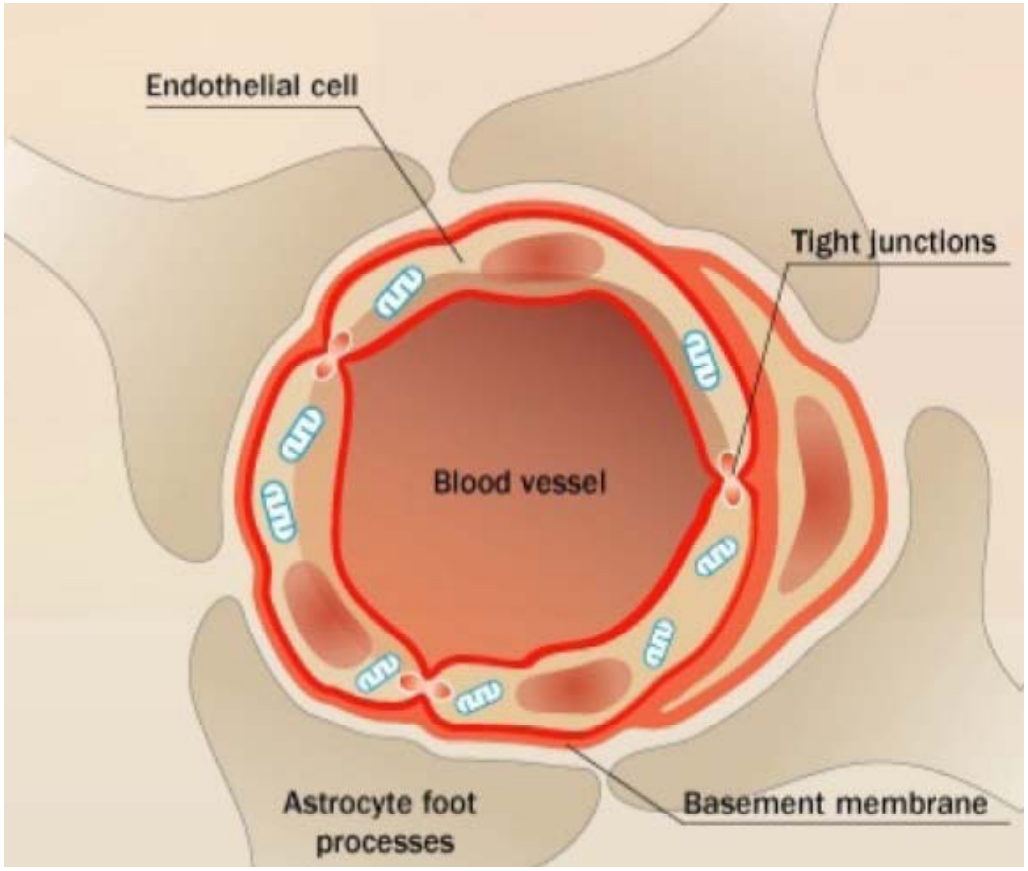
Outline

- Issues
- New therapies and targets
- New approaches to trial design

Reasons for Lack of Progress in Targeted Molecular Therapies in Glioblastomas

- Poor models
- Blood-brain barrier
- Co-activation of tyrosine kinases
- Redundant signaling pathways
- Spatial and temporal heterogeneity
- Failure to genetically enrich patient population
- Stem cells

Bypassing The Blood Brain Barrier



Endothelial cells forming the BBB:

- Express tight junctions
- Lack fenestra
- Lack transendothelial channels
- Lack pinocytic vesicles
- High levels of active efflux proteins, Pgp)

Benarroch **Neurology 2012;78:1268**

Figure 2 Transport mechanisms at the blood-brain barrier (BBB)

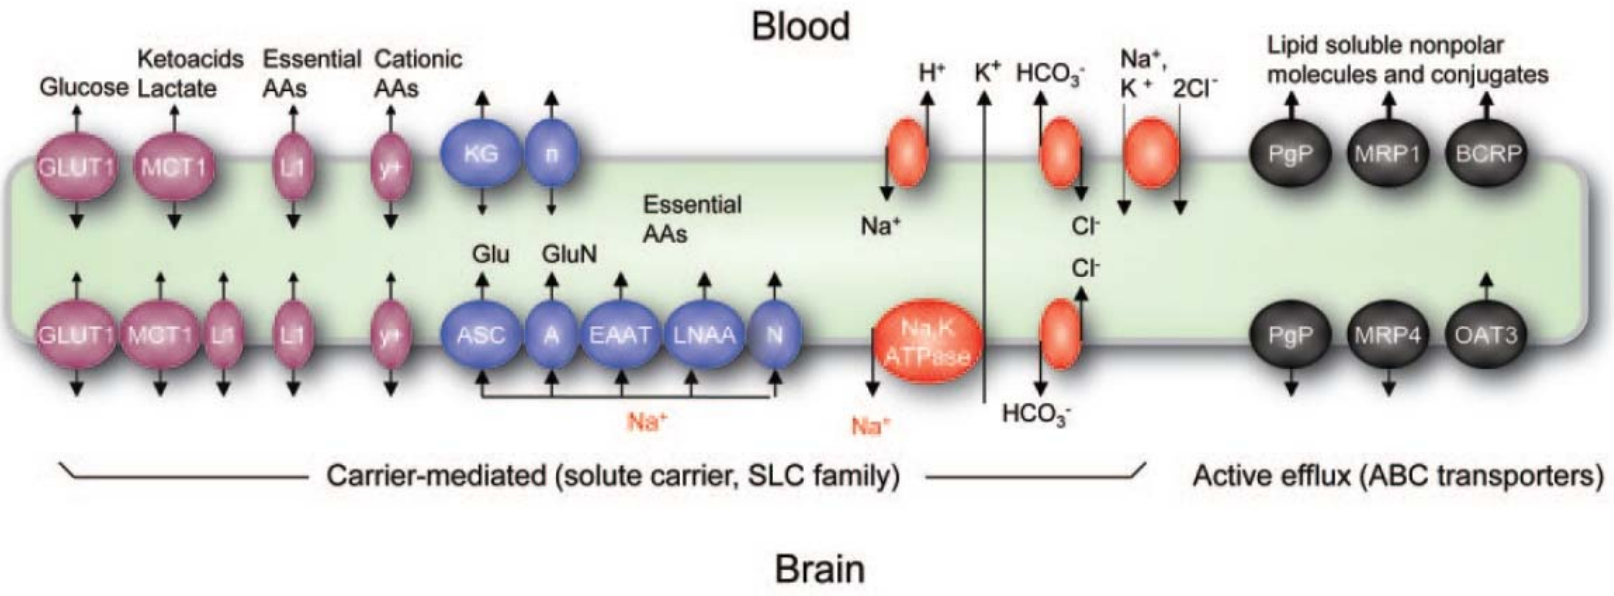


Figure 5. Inhibition of Ficlatuzumab Brain Tumor Penetration by Anti-VEGF Inhibitors in Orthotopic U87 Model

Human IgG-Treated Control

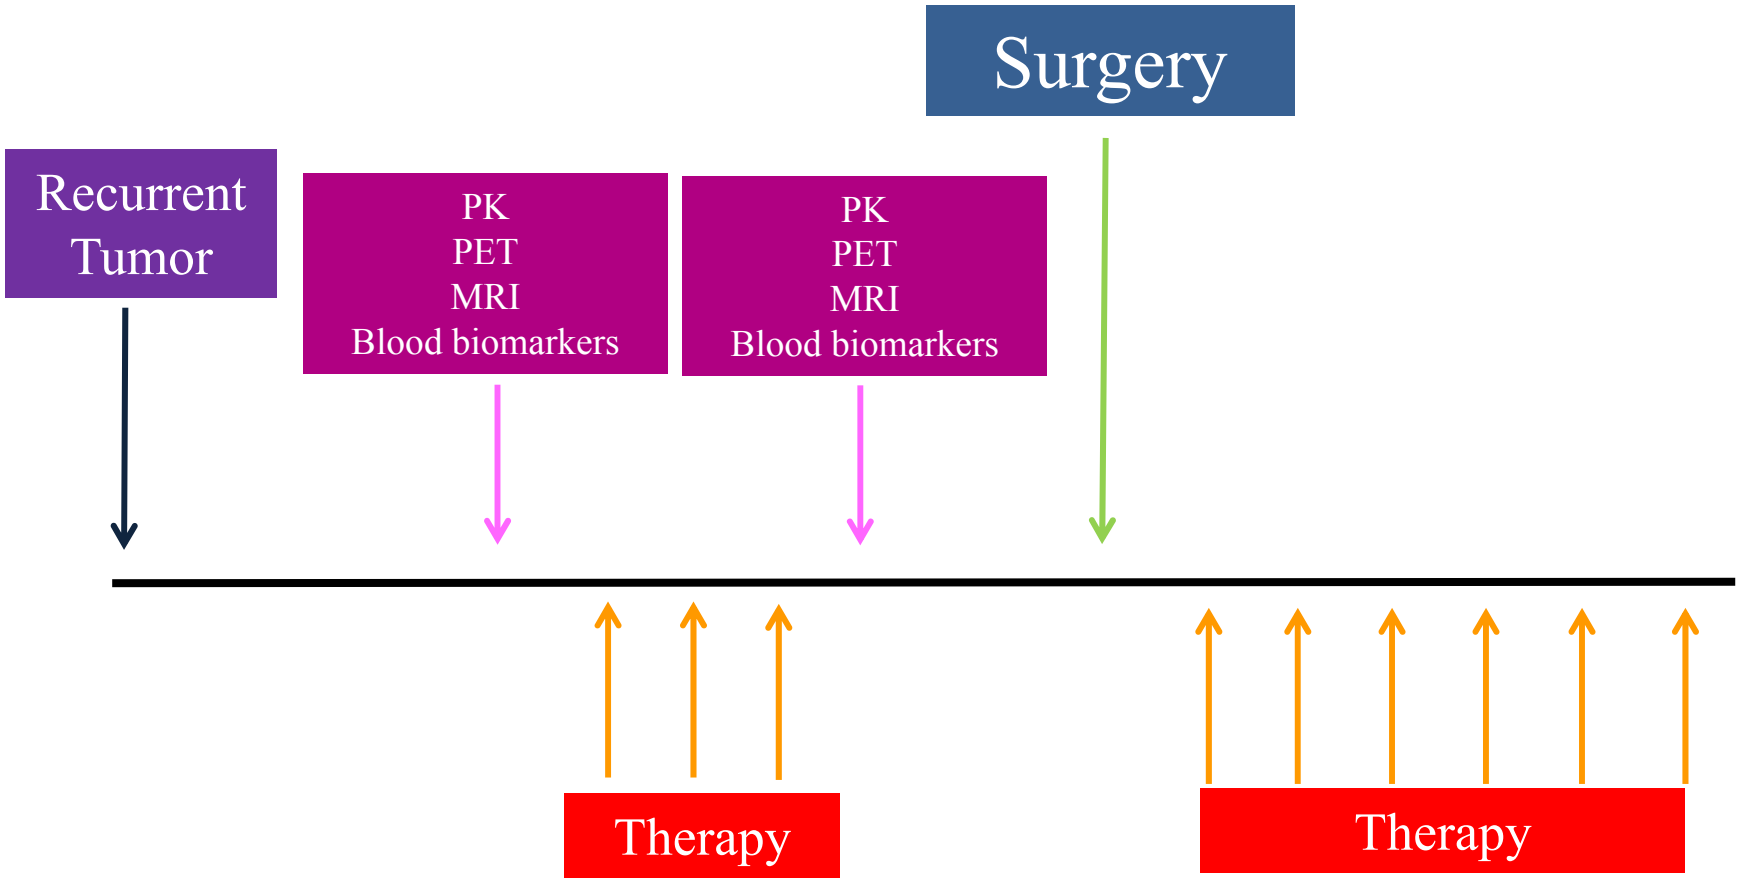
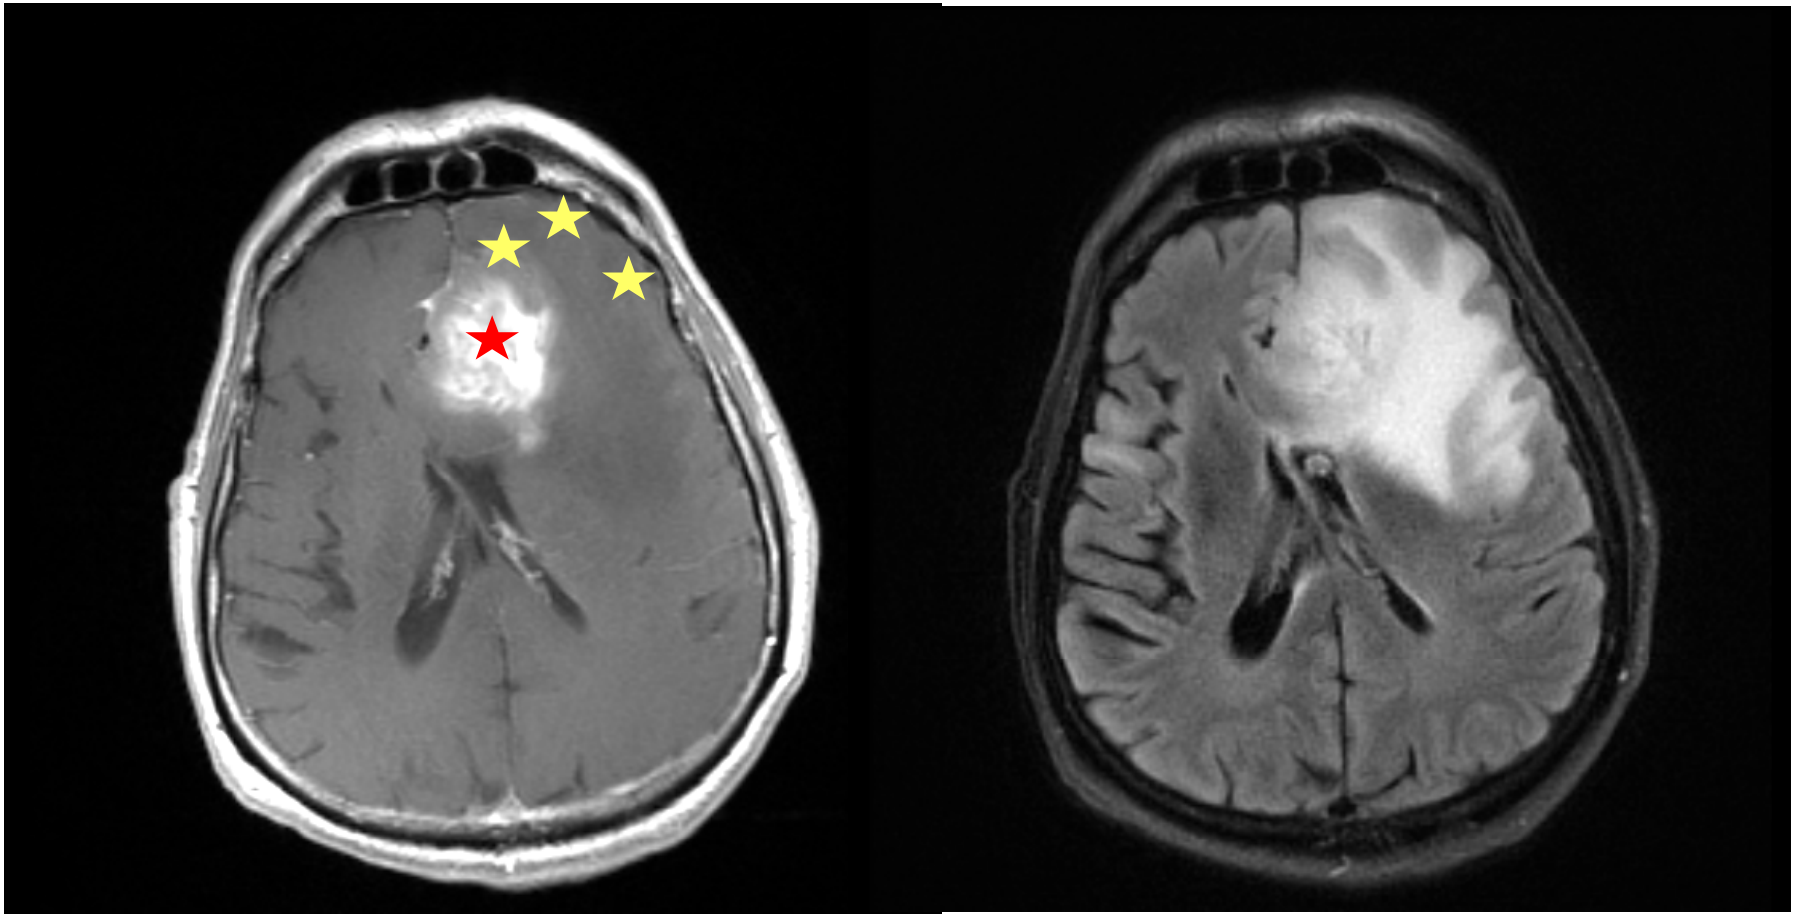
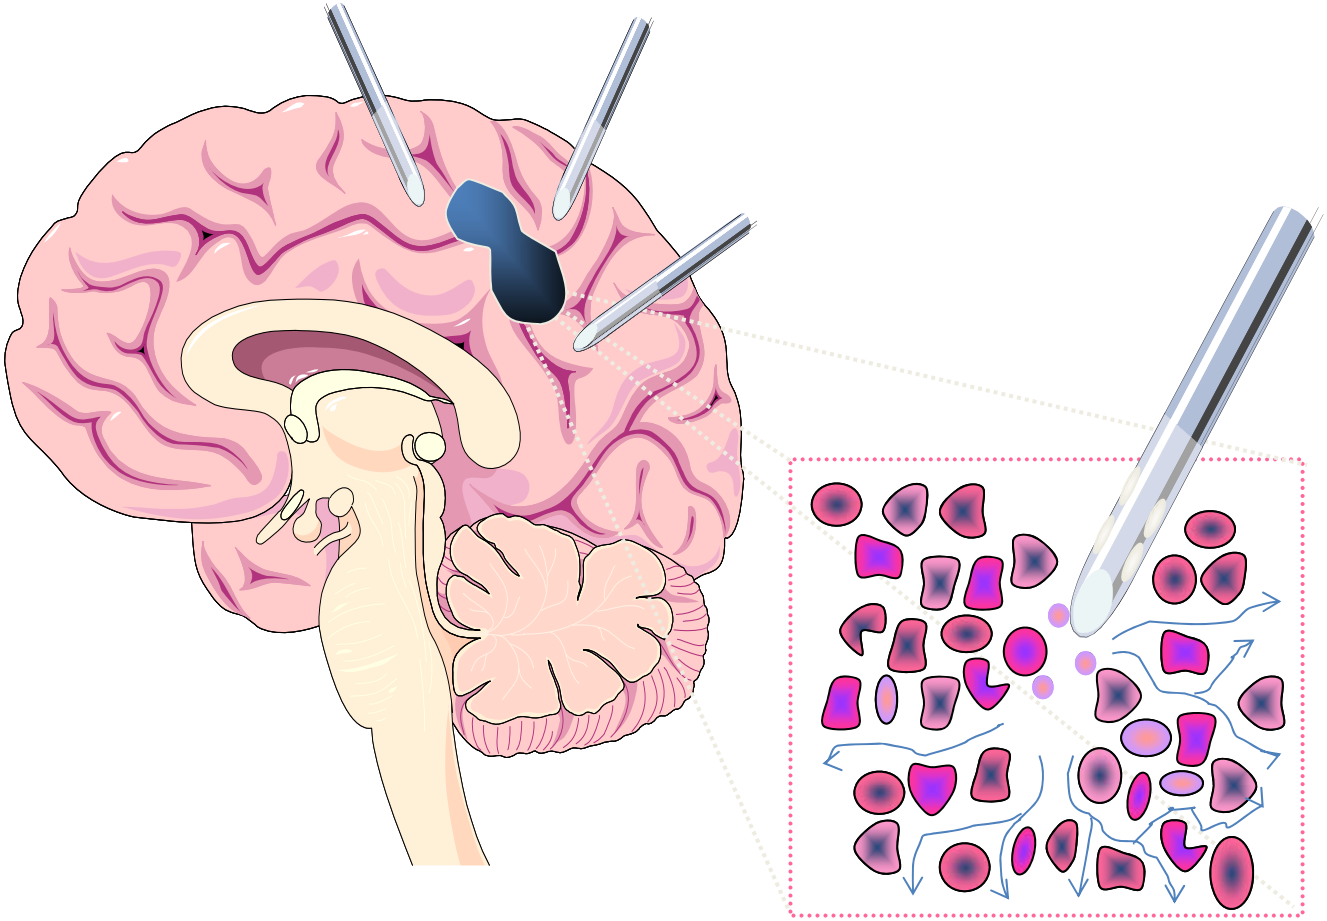
Current Design

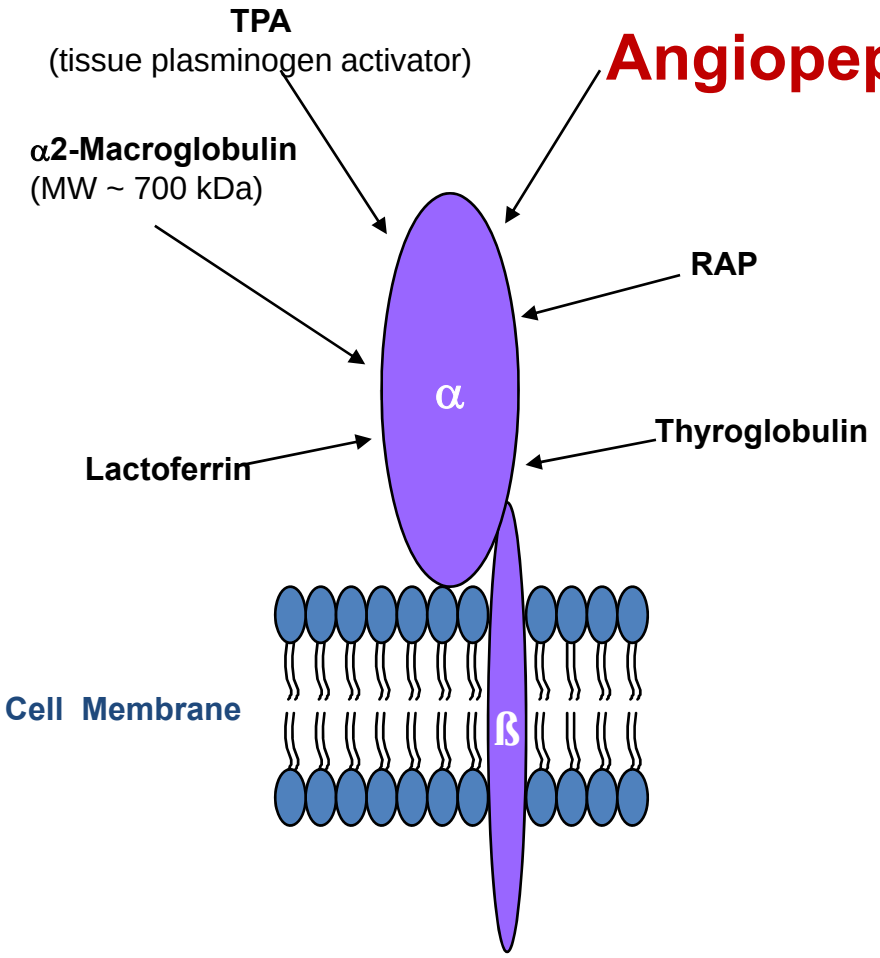




Convection-Enhanced Delivery



Low density Lipoprotein Receptor Related Protein (LRP-1)



LRP-1: ~600kDa

(α:515, β: 85)

- Transports small and large molecules (> 40 ligands)
- One of the most expressed receptor at the surface of the BBB
- Expressed on cancer cells
- Expressed also in liver, lung and ovarian tissues

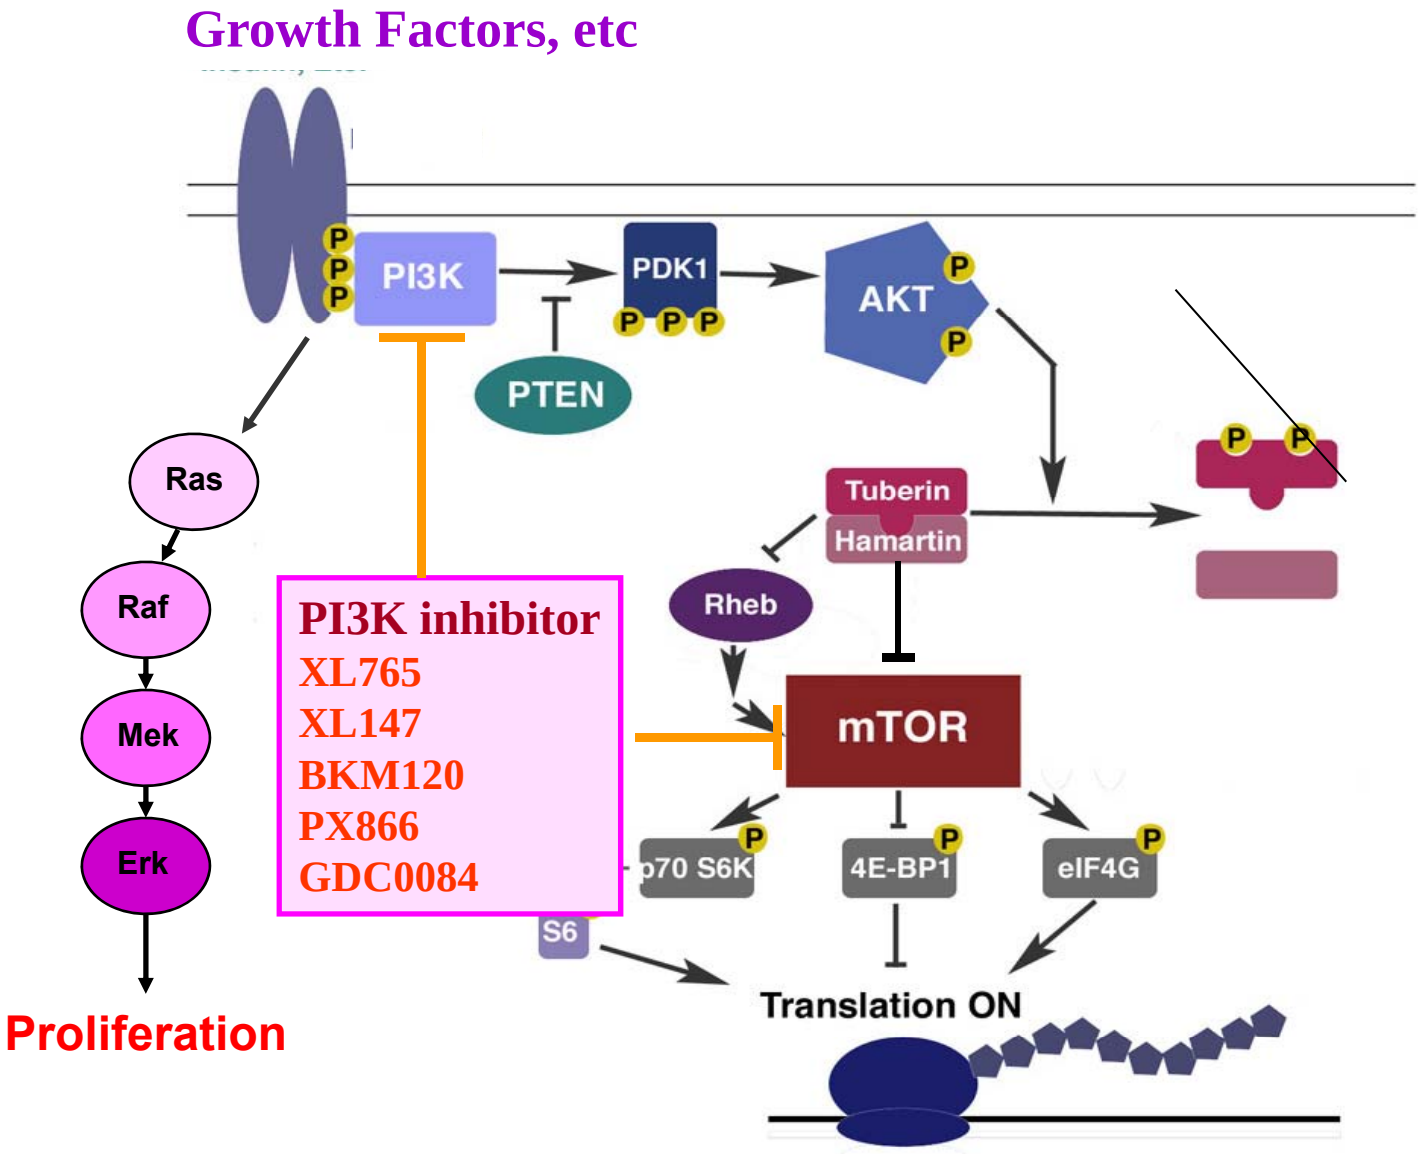
New Targets

- PI3K
- FGFR/TACC
- BRAF
- CDK4
- WeeI

PI3 Kinase Inhibitors



BKM120

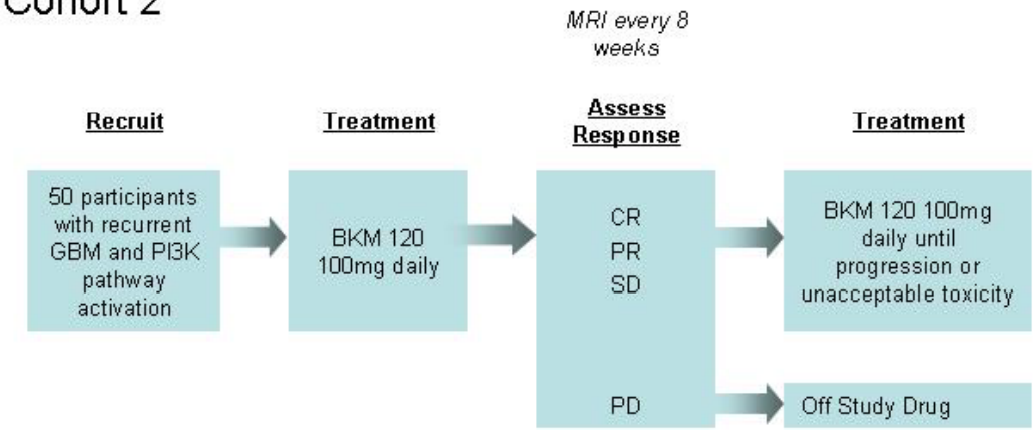
- Oral pan-class I phosphatidylinositol-3-kinase (PI3K) inhibitor belonging to the 2,6-dimorpholino pyrimidine derivative family
- Inhibits p110α, p110β, p110δ and p110γ
- Cross the blood-brain barrier (brain/blood ratio 2)
- Taken orally once daily
- Inhibits the growth of U87MG and GBM explants in vivo

Ivy Foundation Early Phase Clinical Trials Consortium

A Phase II study of BKM120 for patients with recurrent glioblastoma and activated PI3K pathway

Cohort 1

Cohort 2



BKM 120 Trial

Patient Eligibility

- Activation of PI3K pathway:
  - PIK3CA/PIK3R1 mutation or
  - PTEN mutation, loss of PET by FISH, or PTEN IHC negative

Goal

- 30 PTEN loss
- 20 PIK3CA/PIK3R1 mutants

Next Steps

- Isoform specific Inhibitors
  - ? Beta specific isoforms better for PTEN loss
  - ? Alpha specific isoforms for PI3Ca mutants
- Combinations
  - BKM120 +RT+TMZ
  - BKM120 + LDE225 (SMO inhibitor)
  - BKM120 + INC 280 (MET inhibitor)

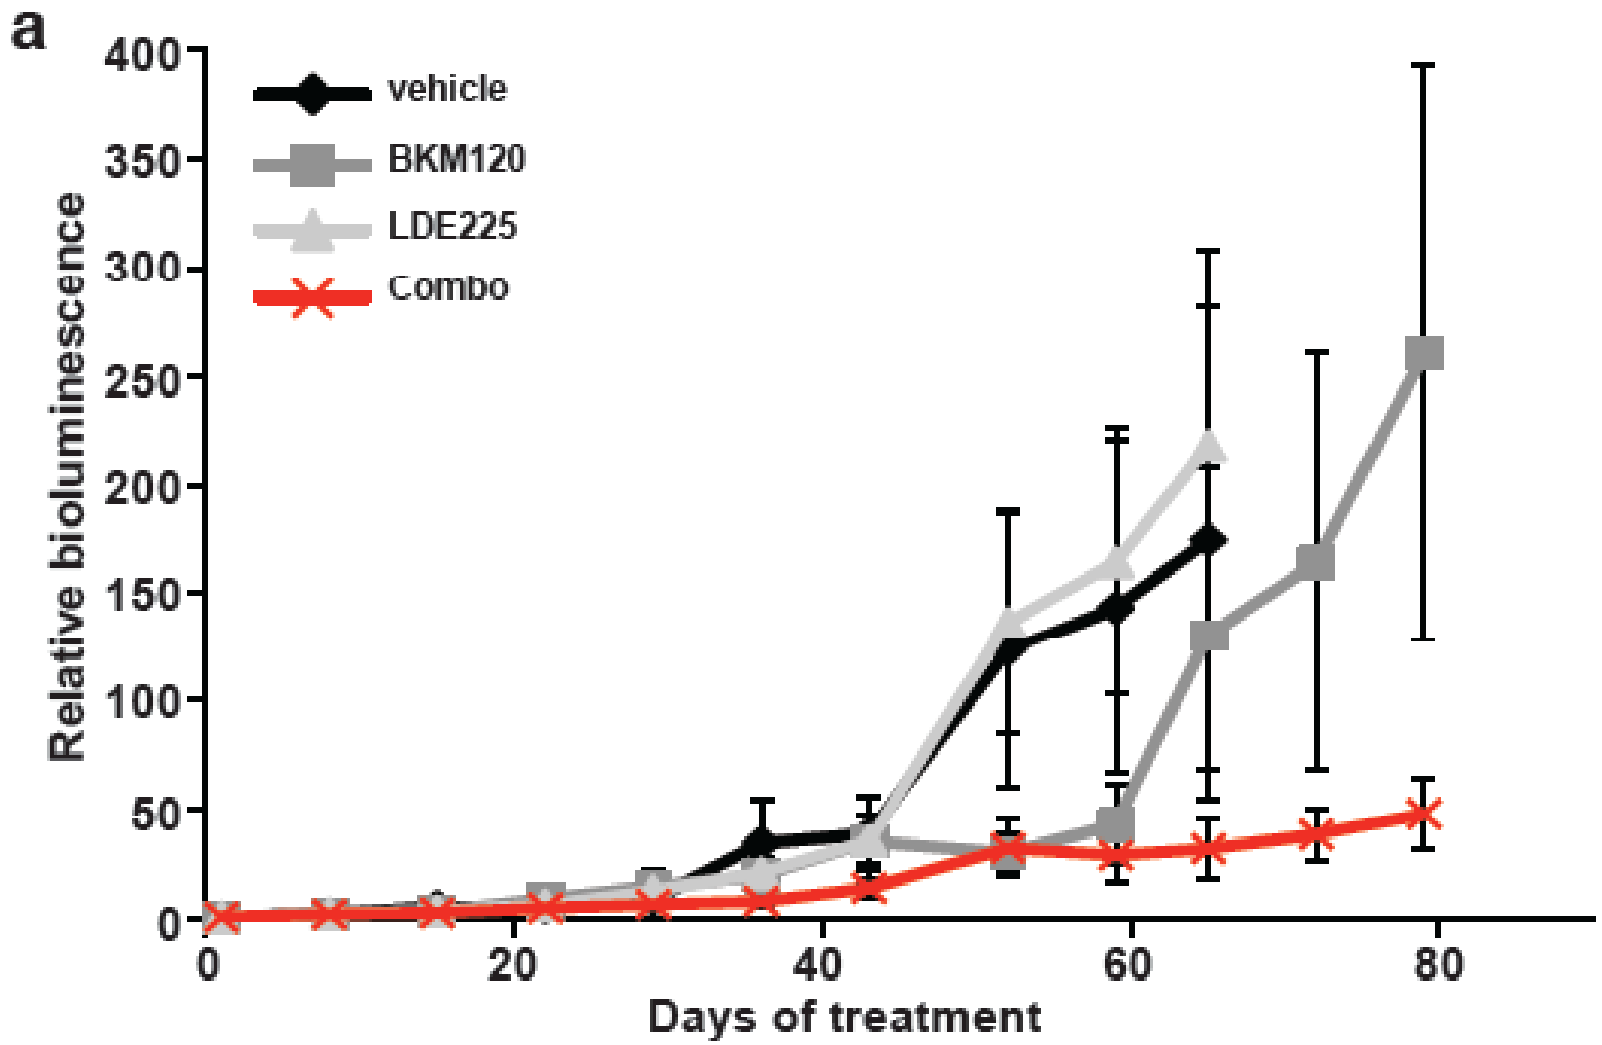
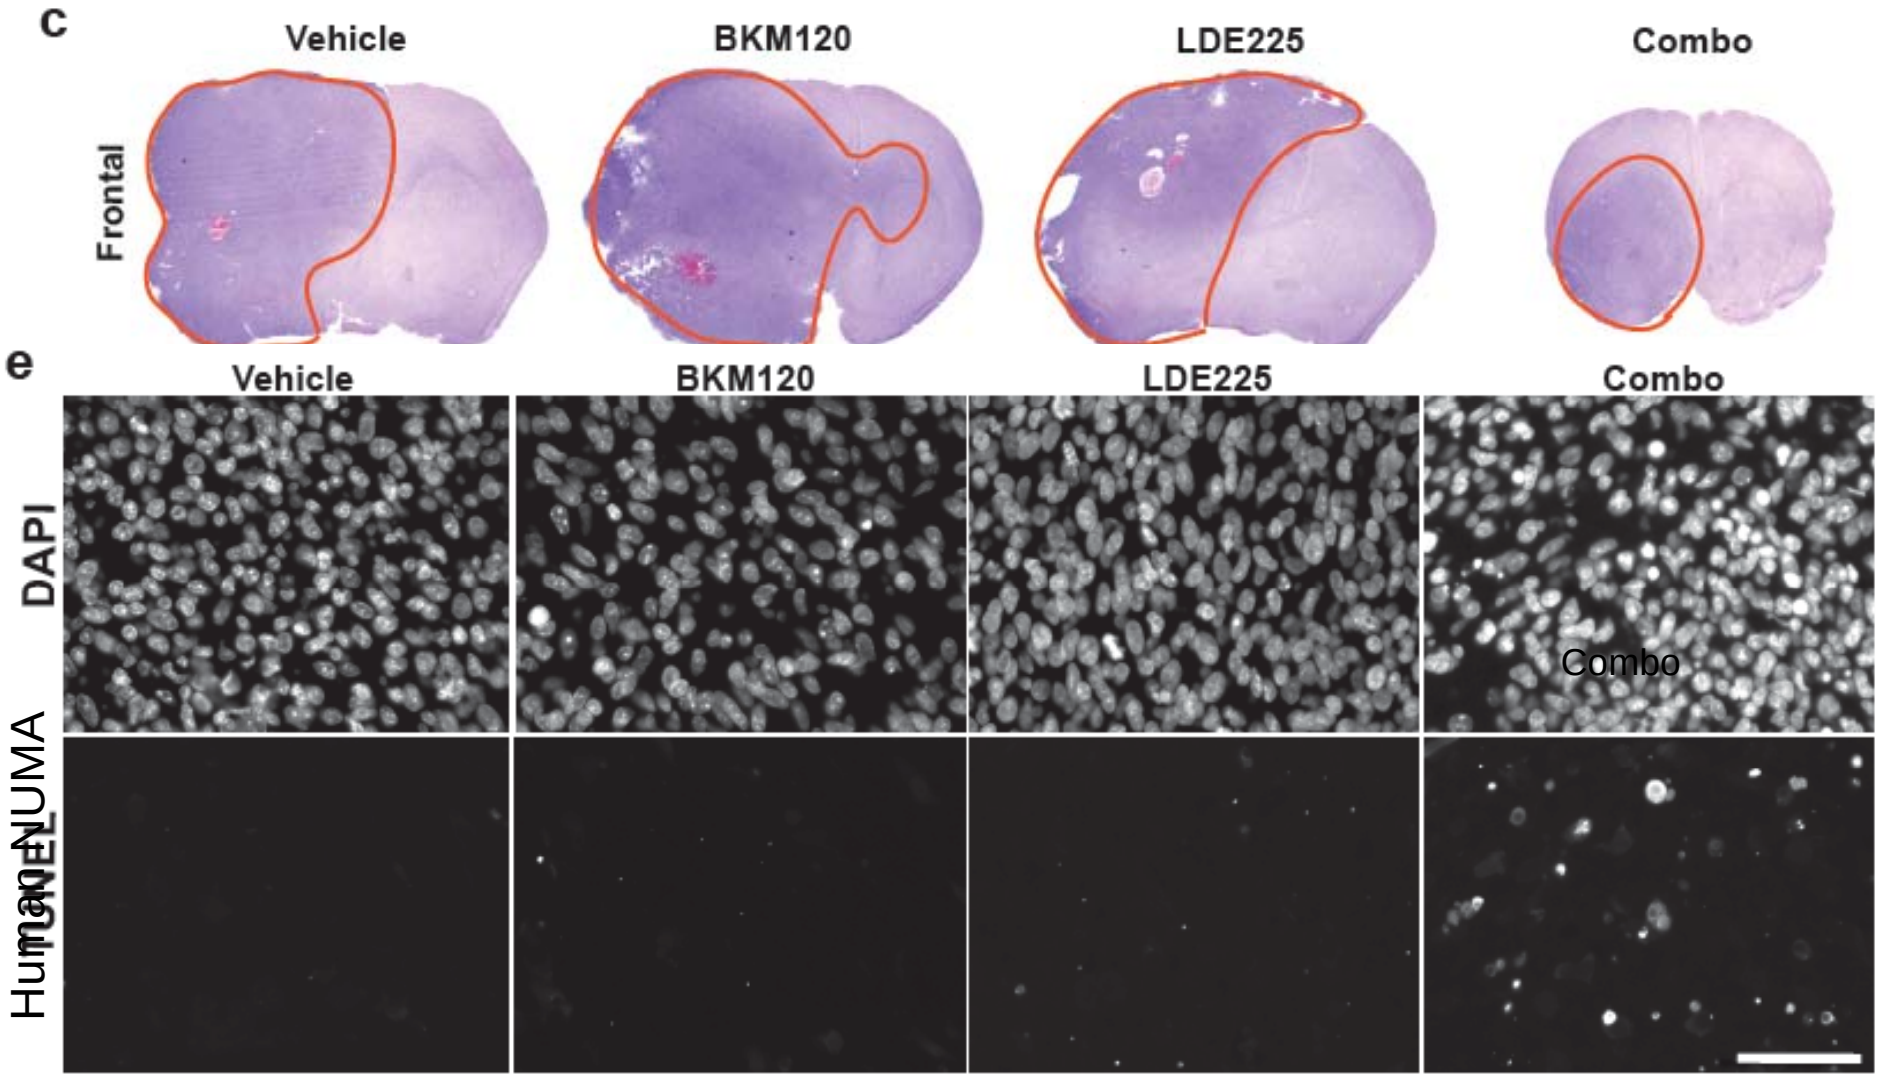
BKM120+LDE225 In vivo data: orthotopic xenograft



Mariella Gruber-Olipitz et al. Nature Med. In Press

LDE225+BKM120



Many choices; limited resources

Challenges

- Phase II trials often not predictive of positive outcome in phase III studies
  - Imatinib mesylate and hydroxyurea
  - Enzastaurin
  - Cediranib
  - Cintredekin Besudotox *(IL13-PE38QQR)*
  - Cilengitide
- More drugs and more combinations
- Limited resources
- Need more efficient trial designs
- Need better response criteria, endpoints and more efficient trials and design

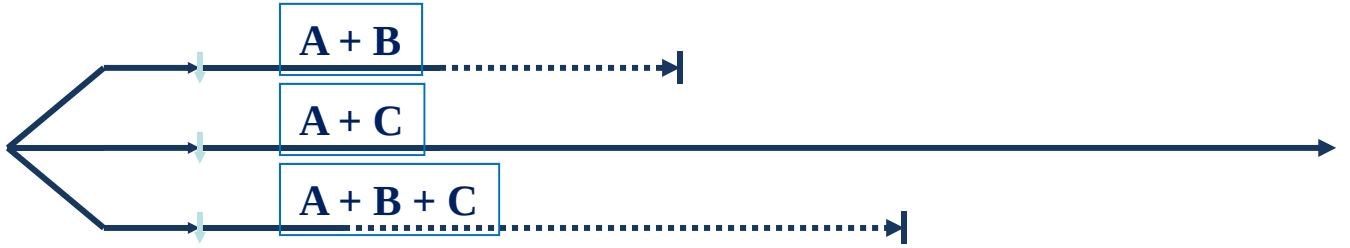
"I want you to find a bold and innovative way to do everything exactly the same way it's been done for 25 years."

New Clinical Trial Designs

- **Improve efficiency**
  - Rapid elimination of ineffective regimens
  - Test multiple combinations simultaneously
  - Shorter path to definitive testing
- **Designs**
  - "Pick the Winner"
  - Seamless integration of phase II/III trials
  - Sequential Accrual Design for Phase I/II studies
  - Factorial Design
  - Adaptive Randomization

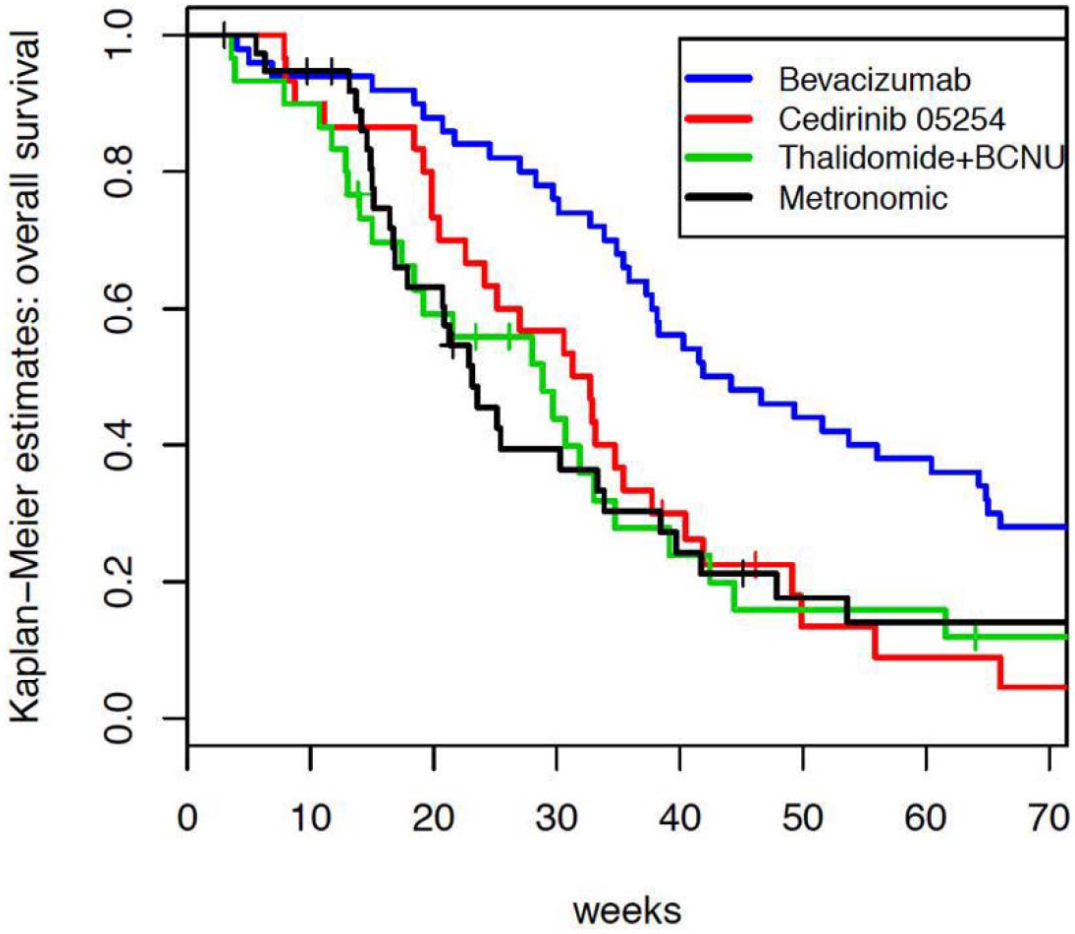
Adaptive Randomization Strategies

- Multiple arm study
- Allocation of patients based on Bayesian probability of treatment efficacy
- Treatment arms with success are more likely to accrue patients
- Treatment arms with poor results are dropped, alternative arms added, and accrual continues until clear evidence of superior treatment(s) emerge

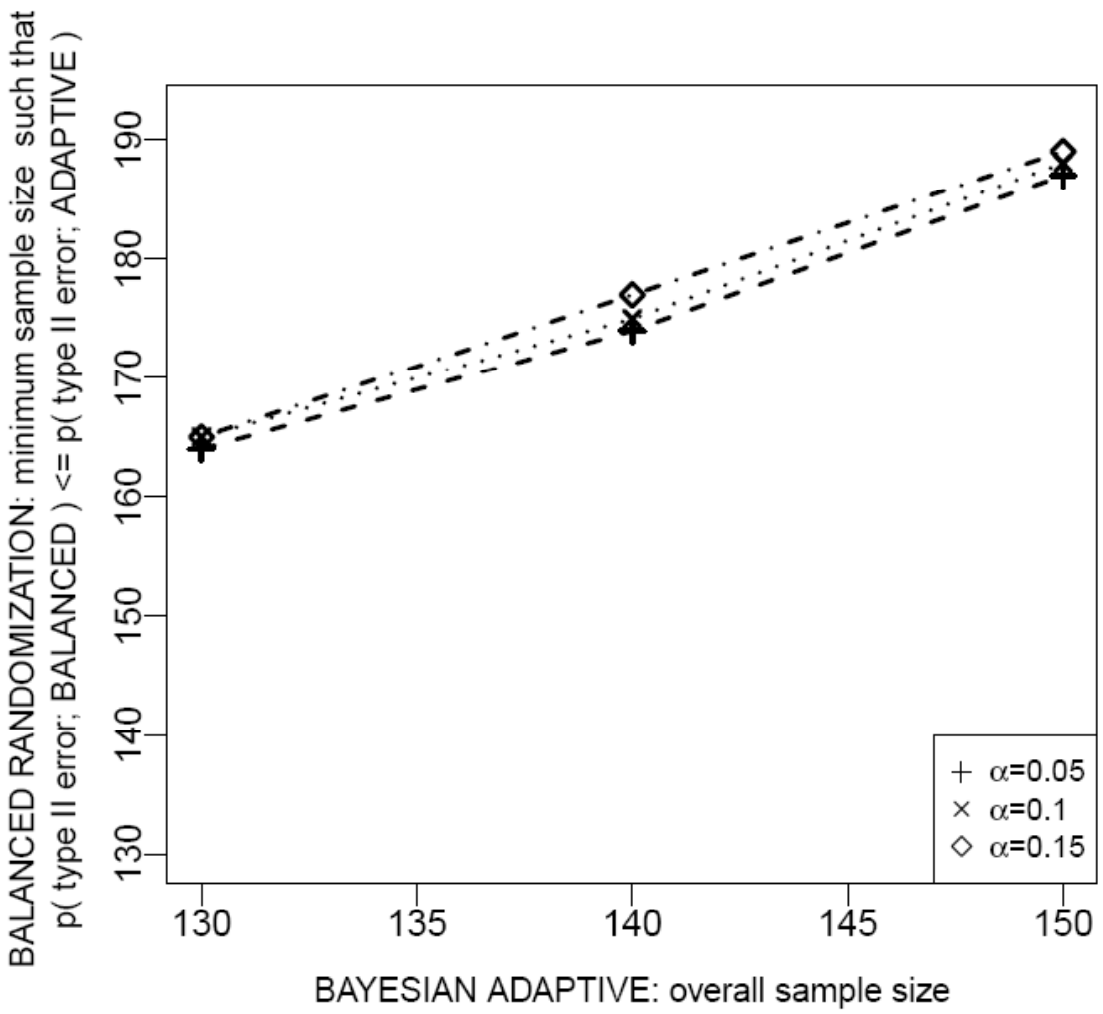


Adaptive Randomized "Bayesian" Design

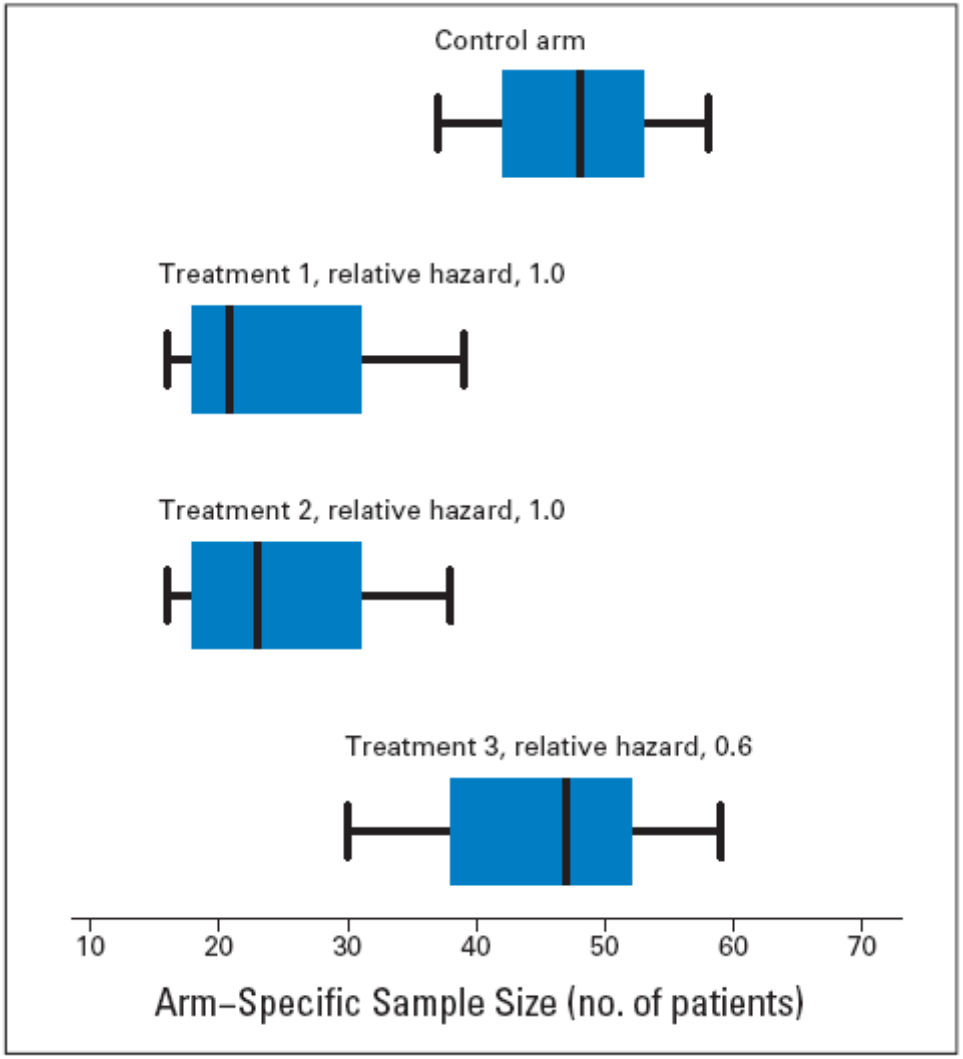
Trippa et al (JCO 2012; *30:3258-3263*)



Trippa et al (JCO 2012;30:3258-3263)



Trippa et al (JCO 2012;30:3258-3263)



Ideally we can have trials that evaluate multiple drugs efficiently and identify predictive biomarkers

Iwanami et al:
Cell Cycle 2013:12:10, 1473–1474

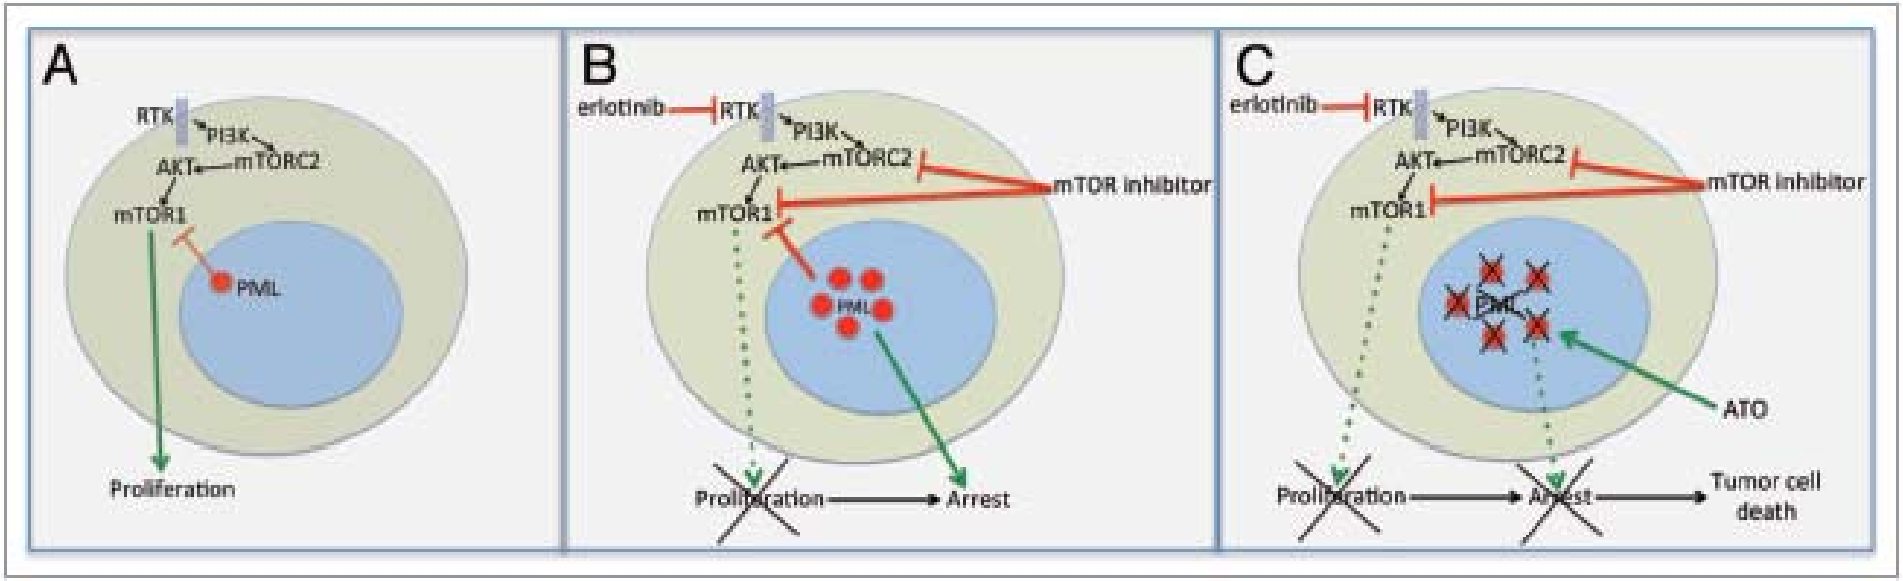

Figure 1. PML mediates resistance to mTOR targeted therapies in GBM, which is reversed by ATO. (**A**) Schematic diagram showing that persistent mTOR signaling promotes tumor cell proliferation, while PML opposes it. (**B**) In GBMs treated with mTOR inhibitors or EGFR inhibitors such as erlotinib that also block mTOR signaling, PML is upregulated, promoting tumor cell arrest. (**C**) ATO, which leads to degradation of PML protein, synergizes with mTOR inhibitors, potently causing tumor cell death.
