Do you want to explore how to prevent cancer? At the German Cancer Research Center (DKFZ) in Heidelberg, Germany’s largest biomedical research institute, the research program “Cancer Risk Factors and Prevention” is dedicated to epidemiological research. Scientists at the DKFZ work hard to identify risk factors and to improve the detection, prognosis and outcomes of cancer.

If you are interested in doing your PhD in the field of epidemiology, why not join the International PhD Program at the DKFZ?

Research activities are focused on:

- Large-scale epidemiologic studies on detection of risk factors, risk markers and prognostic factors of cancer and chronic diseases
- Large-scale epidemiologic studies and clinical trials on more effective cancer prevention and early detection, better prognosis and quality of life of cancer patients, and on quality of medical care
- Integration of genome, proteome and biomarker research into epidemiological studies on the causes and prevention of cancer, and on prognosis and treatment success after a cancer diagnosis
- Research in the field of biostatistical methods and their application in cancer research

For more information about the groups and their research, have a look here.

To apply online to the International PhD Program visit www.dkfz.de/phd

Application deadlines 5th January and 31st May
