DEUTSCHES  
KREBSFORSCHUNGSZENTRUM  
IN DER HELMHOLTZ-GEMEINSCHAFT

# REALLY SHORT BASICS

# Fully-Connected Neural Network

- Each layer fully connects to previous layer
- Difficult to train (many parameters in  $W$  and  $b$ )
- Spatial relations not necessarily preserved

$y(x) = f(W \cdot x + b)$  with  $f(x) = (f(x_1), f(x_2), \dots)$  point-wise scalar, e.g.  $f(x) = x \vee 0 = \text{ReLU}$

# Universal Approximation Theorem<sup>1</sup>

- A fully-connected network with at least three layers is also called a multi layer perceptron (MLP).

*If  $\sigma$  is continuous, bounded and nonconstant, then  $\mathfrak{R}_M(\sigma)$  is dense in the subset  $\mathcal{C}$  of continuous and compact functions of  $\mathbb{R}^M$ .*

$$\begin{aligned}\mathfrak{R}_M(\sigma) &= \bigcup_N \mathfrak{R}_M^{(N)}(\sigma) \\ &= \bigcup_N \left\{ g : \mathbb{R}^M \rightarrow \mathbb{R} \mid \overbrace{g(x) = \sum_{j=0}^N w_{k,j}^{(3)} \sigma \left( \sum_{i=0}^M w_{j,i}^{(2)} x_i \right)}^{3\text{-layer MLP with final activation linear and } N \text{ hidden neurons}} \right\}\end{aligned}$$

- For any function  $h(x) \in \mathcal{C} \in \mathbb{R}^M$  we can find a function  $g(x) \in \mathfrak{R}_M(\sigma)$  for which  $\|h(x) - g(x)\|_p < \epsilon$ .
- Any 3-layer MLP with appropriately chosen layer sizes and activation function, e.g. the sigmoid function, is a universal function approximator.
- **This theorem does not provide any insight into how to find the unknowns!**

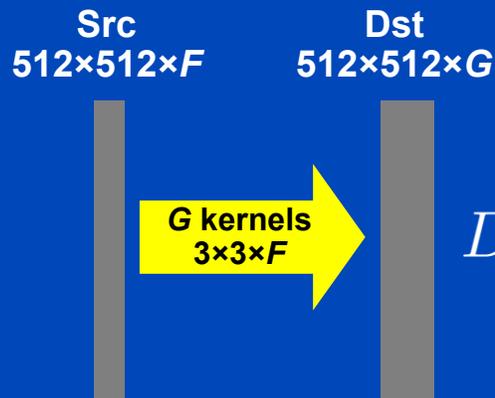

<sup>1</sup>Hornik, Kurt; Stinchcombe, Maxwell; White, Halbert (1989). Multilayer Feedforward Networks are Universal Approximators. Neural Networks. Vol. 2. Pergamon Press. pp. 359–366; Theorem 2

# Convolutional Neural Network (CNN)

- Replace dense  $W$  in  $y(x) = f(W \cdot x + b)$  by a sparse matrix  $W$  with sparsity being of convolutional type (band diagonal of Toeplitz type).
- CNNs consist (mainly) of convolutional layers.
- Convolutional layers are not fully connected.
- Convolutional layers are small, say  $3 \times 3$ , convolution kernels whose entries need to be found by training.
- CNNs preserve spatial relations to some extent.

$$W_{1D} = \begin{pmatrix} 1 & 8 & 0 & 0 & 0 & 0 \\ 2 & 1 & 8 & 0 & 0 & 0 \\ 0 & 2 & 1 & 8 & 0 & 0 \\ 0 & 0 & 2 & 1 & 8 & 0 \\ 0 & 0 & 0 & 2 & 1 & 8 \\ 0 & 0 & 0 & 0 & 2 & 1 \end{pmatrix}$$

*Only three unknowns!*

$$D_{i,j,g} = \sum_f S_{i,j,f} * K_{i,j,f}^g = \sum_{a,b,f} S_{i-a,j-b,f} K_{a,b,f}^g$$

=  $3 \times 3 \times F \times I \times J \times G$  madd operations

**Attention: No convolution in depth direction!**

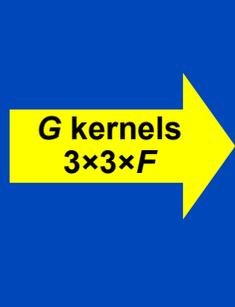

Here, a 2D example is shown. Conv layers also exist in 3D and higher dimensions.

# Convolution Layers

- Input layer  $S$ 
  - vector of size  $I$  with  $F$  features:  $I \times F$
  - image of size  $I$  by  $J$  with  $F$  features:  $I \times J \times F$
  - volume of size  $I$  by  $J$  by  $K$  with  $F$  features:  $I \times J \times K \times F$
  - ...
- Convolution kernel  $K$ 
  - $G$  kernels of size  $(2A+1) \times (2B+1) \times F$  with or without padding\*
- Output layer  $D$ 
  - same spatial dimensions as input layer\*
  - $G$  features (depth  $G$ )

Src  
 $512 \times 512 \times F$

Dst  
 $512 \times 512 \times G$

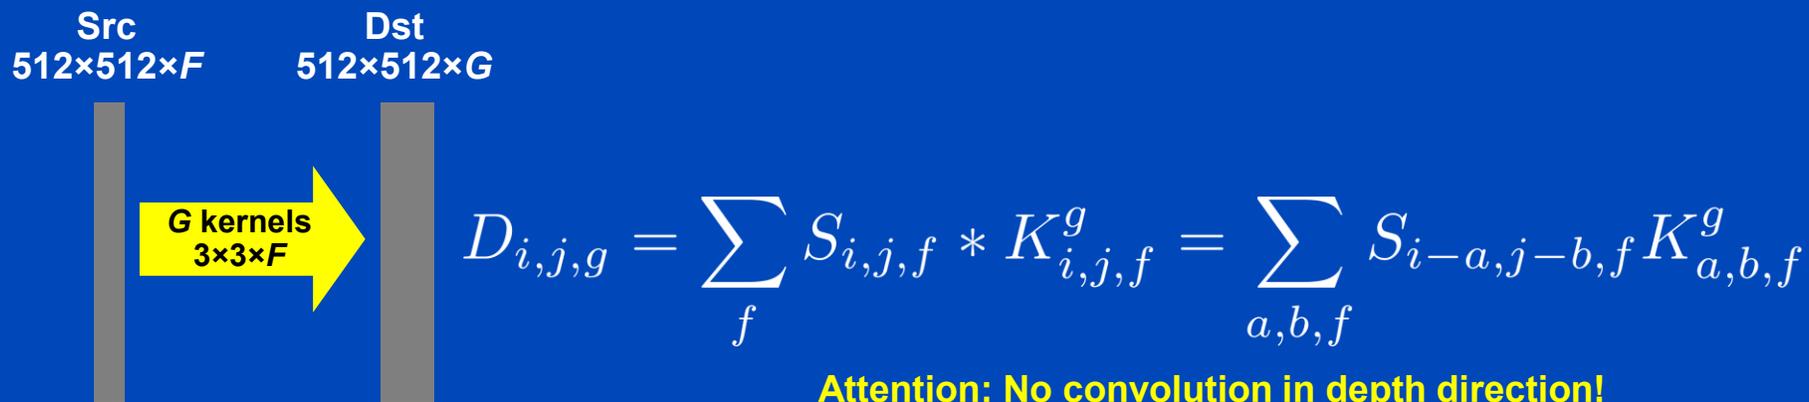

$$D_{i,j,g} = \sum_f S_{i,j,f} * K_{i,j,f}^g = \sum_{a,b,f} S_{i-a,j-b,f} K_{a,b,f}^g$$

**Attention: No convolution in depth direction!**

\*Convolution may include a stride (step size)  $> 1$ . Similar to convolution with stride 1 followed by pooling.

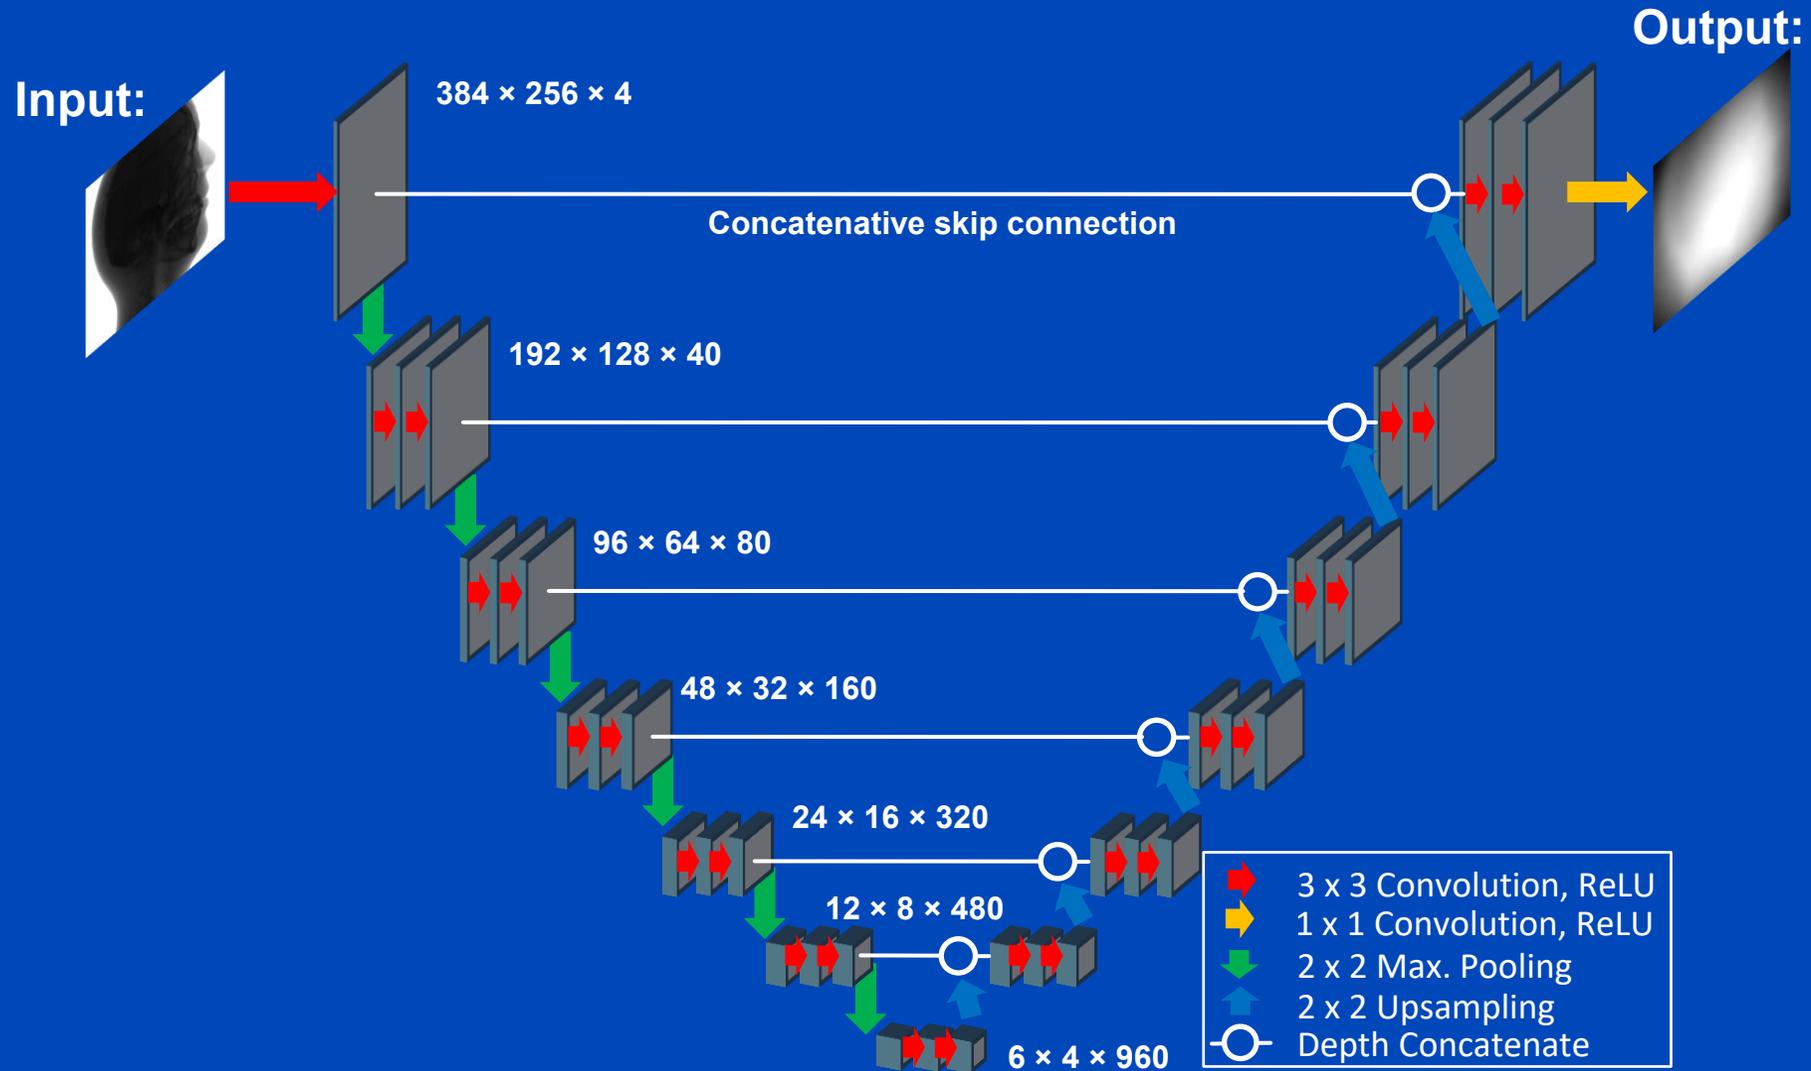

# Convolution Layers

- Convolution in spatial domain (1D, 2D, 3D, ...)
- Full connectivity in depth
- Filter size, number of filters, receptive field
- Learns filter kernels
- Far less parameters than fully connected layers
- Respects properties of many imaging systems

**Attention: No convolution in depth direction!**

# U-Net<sup>1</sup>

<sup>1</sup>O. Ronneberger, P. Fischer, and T. Brox. U-net: Convolutional networks for biomedical image segmentation. Proc. MICCAI:234-241, 2015.

# Loss Function

- The neural network coefficients (weights and biases)  $\mathbf{c}$  are chosen by minimizing a loss function (cost function)

$$\mathbf{c} = \arg \min_{\mathbf{c}} \sum_{n=1}^N L(\mathbf{c}, \mathbf{x}_n, \mathbf{y}_n)$$

with  $\mathbf{x}_n$  being the training data input,  $\mathbf{y}(\mathbf{c}, \mathbf{x}_n)$  being the network output, and  $\mathbf{y}_n$  being the so-called labels, i.e. the training target, and  $N$  being the number of training samples.

- An example for such a loss function is the MSE loss

$$L(\mathbf{c}, \mathbf{x}_n, \mathbf{y}_n) = \left( \mathbf{y}(\mathbf{c}, \mathbf{x}_n) - \mathbf{y}_n \right)^2$$

# Toy Example

Nested scalar functions  $f(c, x)$  with unknown coefficients  $c$

Loss  
Function

$$L(c_3, c_2, c_1, x) = (f_3(c_3, f_2(c_2, f_1(c_1, x))) - y)^2$$

last layer output  
2<sup>nd</sup> layer output  
1<sup>st</sup> layer output  
input  
training target

Intermediate  
Values

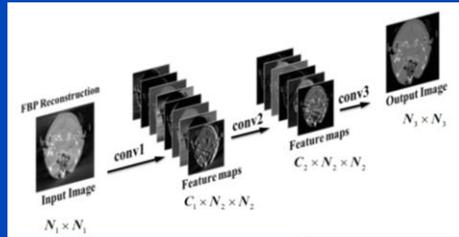

$$\begin{aligned} L_3 &= \frac{dL}{df_3} = 2(f_3 - y) \\ L_2 &= \frac{dL}{df_2} = \frac{dL}{df_3} \frac{df_3}{df_2} = L_3 \frac{df_3}{df_2} \\ &\dots \\ L_n &= \frac{dL}{df_n} = L_{n+1} \frac{df_{n+1}}{df_n} \end{aligned}$$

Desired  
Gradients

$$\begin{aligned} \frac{dL}{dc_3} &= \frac{dL}{df_3} \frac{df_3}{dc_3} = L_3 \frac{df_3}{dc_3} \\ \frac{dL}{dc_2} &= \frac{dL}{df_3} \frac{df_3}{df_2} \frac{df_2}{dc_2} = L_2 \frac{df_2}{dc_2} \\ &\dots \\ \frac{dL}{dc_n} &= L_n \frac{df_n}{dc_n} \end{aligned}$$

### Reducing Metal Streak Artifacts in CT Images via Deep Learning: Pilot Results

Lei Guo, Qingyuan Tang, Yan-Yu, Binbin Chen, Tianxin Gu, Binbin Guo, Guo-Wei

- Takes 32x32 input patch from NMAR image and produces 20x20 output patch
- Very basic CNN

### Gjesteby, 2017

- Same network as in previous work
- Detail image is the high-pass filtered original image
- Detail image and NMAR image are both put as inputs in 2 streams that converge later in the CNN
- Network uses residual error and cost function is a combination of MSE and perceptual loss

### Deep Neural Network for CT Metal Artifact Reduction with a Perceptual Loss Function

Lei Guo, Qingyuan Tang, Yan-Yu, Binbin Chen, Tianxin Gu, Binbin Guo, Guo-Wei

### Gjesteby, 2018

- Inputs for the network are the NMAR image and the high-pass filtered original image
- Corrects streaks after NMAR
- Loss function is MSE or perceptual loss (from VGG network)
- MSE shows over-smoothing
- Trained on simulated data
- Each residual unit learns residual error

### Gjesteby, 2018

### A dual-stream deep convolutional network for reducing metal streak artifacts in CT images

Lei Guo, Qingyuan Tang, Yan-Yu, Binbin Chen, Tianxin Gu, Binbin Guo, Guo-Wei

### Gjesteby, 2019

### Gjesteby, 2019

### Gjesteby, 2019

### Metal artifact reduction for practical dental computed tomography by improving interpolation-based reconstruction with deep learning

Kunlun Liang, Li Zhang, and Qingyuan Tang

### Xing, 2019

- Perform initial LIMAR to obtain images with interpolation artifacts
- Apply U-Net to pre-corrected images to reduce artifacts
- Network minimizes L2-norm loss outside of the metal regions

### Xing, 2019

### Metal artifact reduction on cervical CT images by deep residual learning

Yu Huang<sup>1,2</sup>, Jian Wang<sup>1,2</sup>, Fan Tang<sup>1,2</sup>, Tai Zhong<sup>1,2</sup> and Yu Zhang<sup>1,2</sup>

### Zhang, 2018

### Zhang, 2018

- Metal is placed in real CT images. Artifacts are created by forward and back-projecting soft tissue, bone, and metal
- Network input is patch of artifact image  $I$  and output is the residual, i.e.  $R = I - G^T$
- Loss function is MSE of the residual
- Learning the residual is found to be better than learning the artifact-free image (no images)

### Convolutional Neural Network Based Metal Artifact Reduction in X-Ray Computed Tomography

Wei Zhang<sup>1</sup>, Senior Member, IEEE, and Hongping Yu<sup>1</sup>, Senior Member, IEEE

### Yu, 2018

### Yu, 2018

- Training data are generated from clinical data with metal artifacts added afterwards through polychromatic forward- & back-projection
- Cost function is MSE
- CNN gets patches from the artifact BHC corrected, and LI corrected image as input, produces corrected patches
- Prior image is generated from CNN result by segmenting water and setting it to the average value of all water pixels and leaving bone intact
- Metal trace in the uncorrected sinogram is replaced with values from the prior image
- Having different types of MAR as input improves results

### Metal-Artifact Reduction Using Deep-Learning Based Sinogram Completion: Initial Results

Reinhold E. H. Chen, Yuesha He, Luca A. Scudiero, Guo-Wei, Binbin Guo

### Claus, 2017

- Trained and evaluated on simulated data with metal circle in the center (no other positions tested)
- Data are heavily simplified (random ellipses)
- Inputs are 2 81x21 sized patches from the sinogram next to metal patch. Won't work for complex metals
- Relatively small network (4 layers)

### Deep Learning Based Metal inpainting in the Projection Domain: Initial Results

Thomas M. Gottschalk<sup>1,2,3,4</sup>, Björn W. Kubler<sup>1</sup>, Holger Köster<sup>1</sup>, and Andreas Högl<sup>1</sup>

### Gottschalk, 2019

- Corrects C-Arm projection data
- Data were obtained by placing metal on top of human knee cadavers
- Loss function is MSE
- Networks are based on U-Net with additional skip connection from original image to output
- Basic network can be used to implicitly segment the metal for the Mask-MAR-Net
- Providing a metal mask significantly improves results
- Results are blurred slightly

### Gottschalk, 2019

### Deep Learning based Metal Inpainting in the Projection Domain using additional Neighboring Projection Information

Thomas M. Gottschalk, Björn W. Kubler and Andreas Högl

### Gottschalk, 2020

- U-Net corrects CBCT projections
- Has metal mask and 10 neighbouring projections as additional input channels

### Gottschalk, 2020

### Fast Enhanced CT Metal Artifact Reduction using Data Domain Deep Learning

Mohammad Oussou Ghani, W. Chen, Karl, Felton, IEEE

### Ghani, 2019

- Metal trace is replaced via a CGAN
- Uses transfer learning from training data to real data; not described in depth
- Not applied to medical images

### Ghani, 2019

### Generative Mask Pyramid Network for CT/CBCT Metal Artifact Reduction with Joint Projection-Sinogram Correction

Benli Liu<sup>1,2</sup>, Wei-An Liu<sup>1</sup>, Zhiliang Han<sup>1</sup>, Leren Vongphimol<sup>1</sup>, William J. Siskin<sup>3</sup>, Si-Kwon Zhou<sup>3</sup>, and Jiebo Luo<sup>1</sup>

### Liao, 2019

### Liao, 2019

- First replaces metal trace in the projections (i.e. fixed angle but varying  $\xi$  and  $z$ )
- Then transforms the projections into sinograms and uses a second network to improve those
- Both networks are GANs with a U-Net generator and CNN discriminator
- Uses a Mask Pyramid to ensure the metal mask is seen by all stages of the U-Net
- Data are regular CT scans with metal traces from other patients imposed on them

### DuoNet: Dual Network for CT Metal Artifact Reduction

Wei-An Liu<sup>1</sup>, Benli Liu<sup>1</sup>, Cheng Peng<sup>1</sup>, Xiaohang Tang<sup>1</sup>, Jinglai Zhang<sup>1</sup>, Jiebo Luo<sup>1</sup>, Renee Chellappa<sup>2</sup>, Shaohua Kevin Zhou<sup>2</sup>

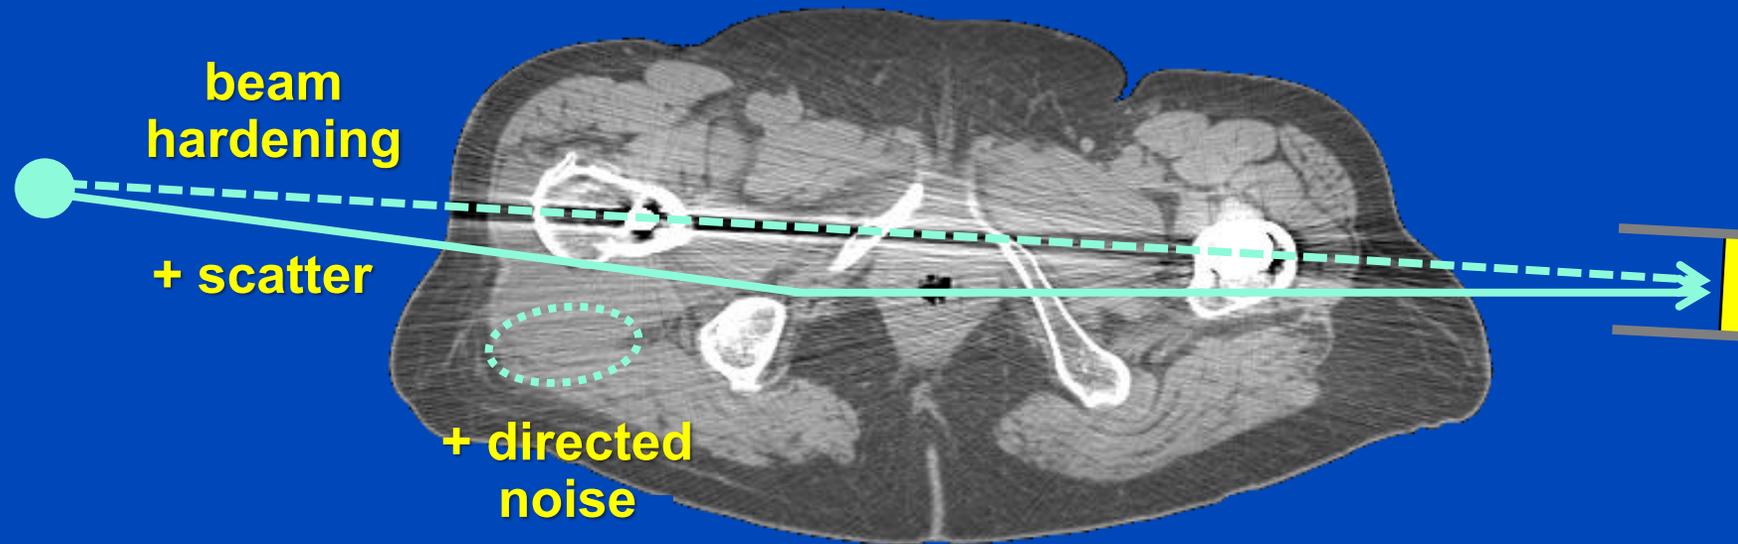

### Lin, 2019

### Lin, 2019

- Input are LI pre-corrected sinograms/images
- First improves the sinograms through a U-Net with mask pyramid (so all parts of the U-Net see the mask)
- Then applies FBP (Radon Inversion Layer) and uses the result as input for a second U-Net, which improves it in image domain
- Unclear how the LI and CNN results are combined

# Metal artifacts are

**Abstract**

**Background:** The reconstruction of a computed tomography (CT) image can be compromised by artifacts, which, in many cases, reduce the diagnostic value of the image. These artifacts often result from missing or corrupt regions in the projection data, for example, by truncation, metal, or limited angle acquisitions.

**Purpose:** In this work, we introduce a novel deep learning-based framework, latent space reconstruction (LSR), which enables correction of various types of artifacts arising from missing or corrupted data.

**Methods:** First, we train a generative neural network on uncorrupted CT images. After training, we iteratively search for the point in the latent space of this network that best matches the compromised projection data we measured. Once an optimal point is found, forward-projection of the generated CT image can be used to inpaint the corrupted or incomplete regions of the measured raw data.

# Image Domain Experiment

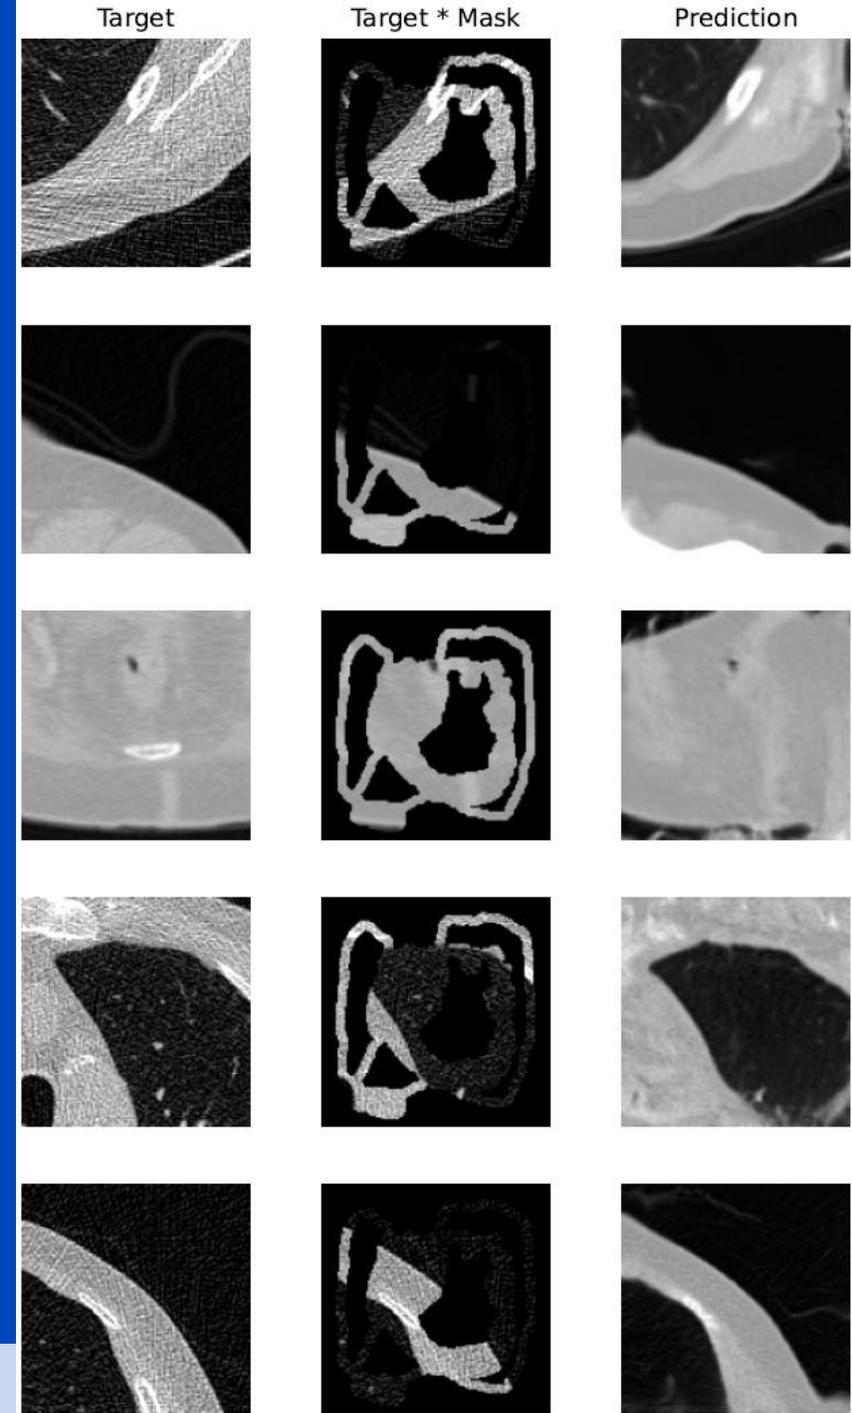

- Purely image domain
- Hand-crafted mask

- Minimizing

$$z = \arg \min_z \|D(z) - M(\mathbf{r})f(\mathbf{r})\|$$

- Results see rhs.

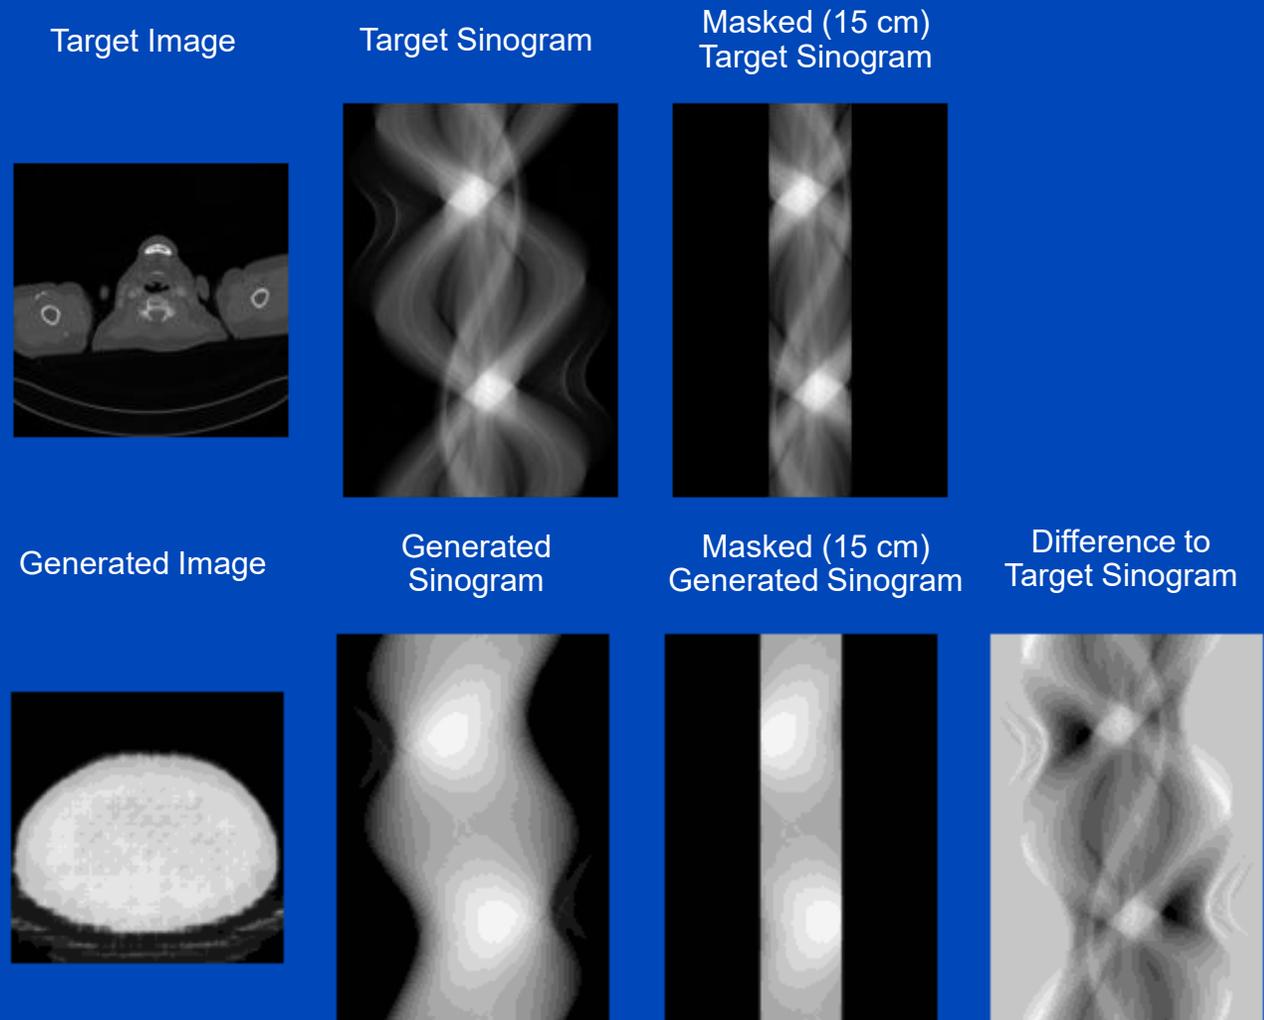

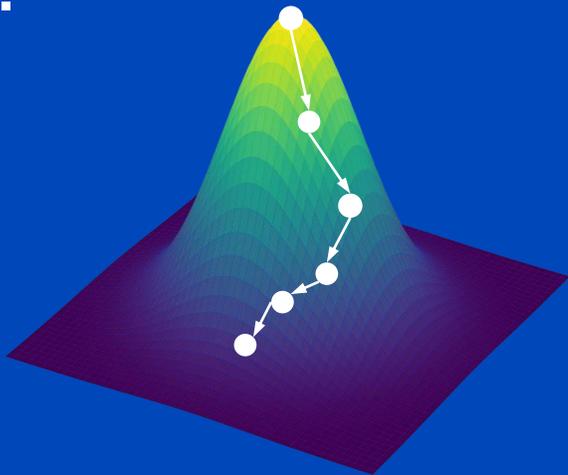

# Search in Latent Space

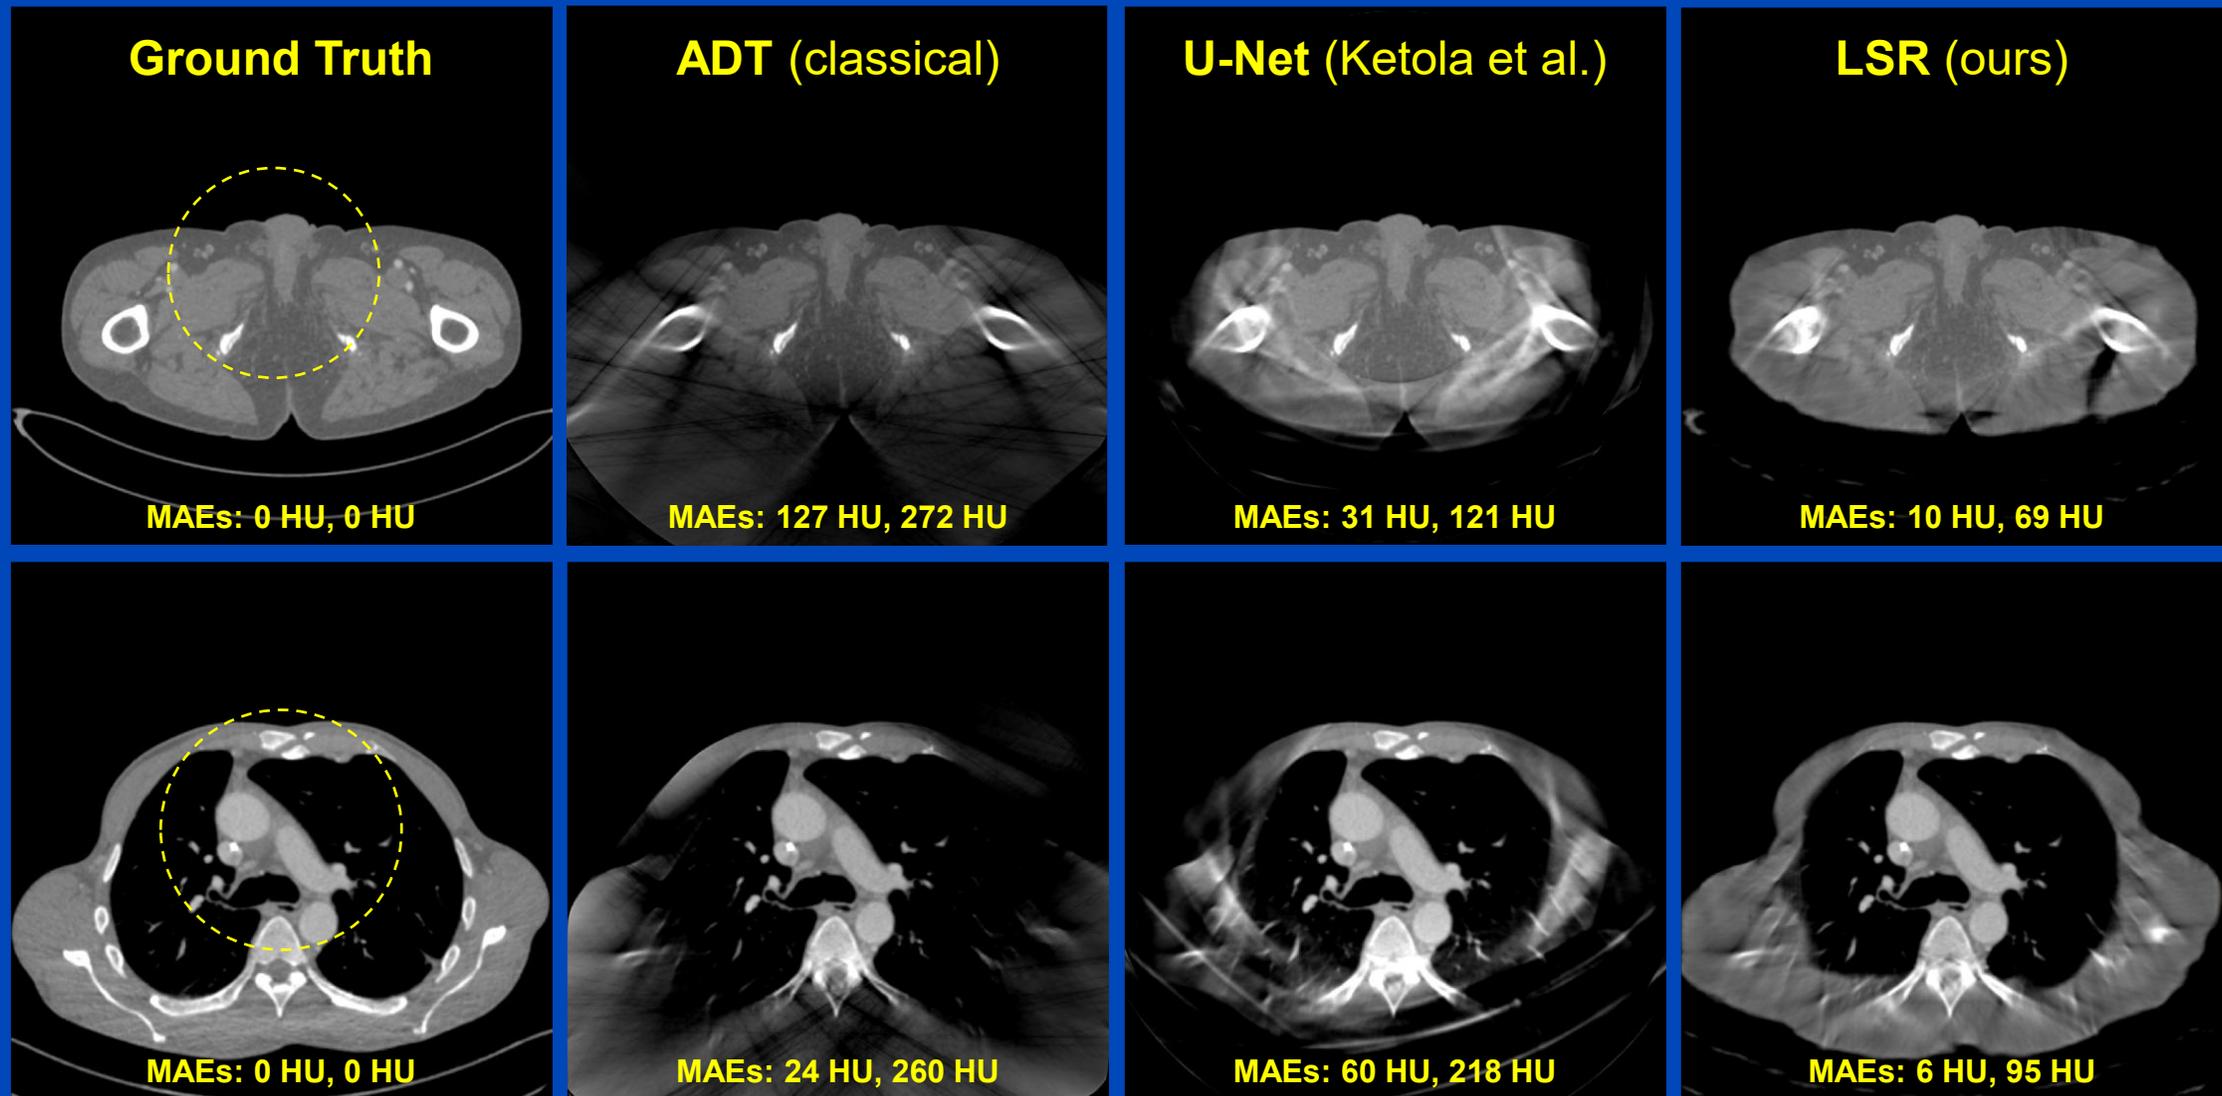

- Optimization of latent space vector in projection domain

$$z = \arg \min_z \|XD(z) - p\|_{15 \text{ cm}}$$

- Video showing intermediate images of selected iteration steps.

# Results

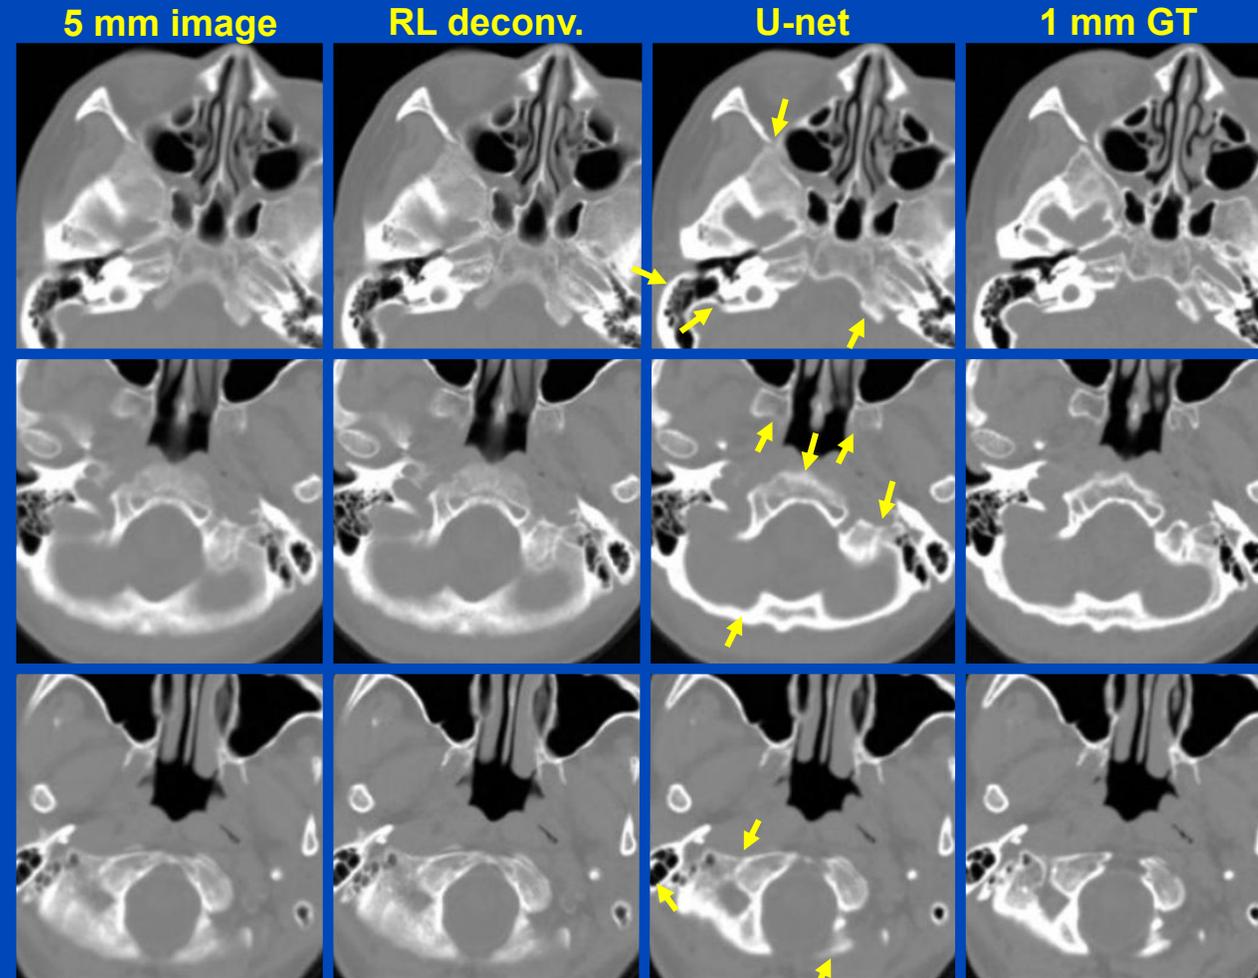

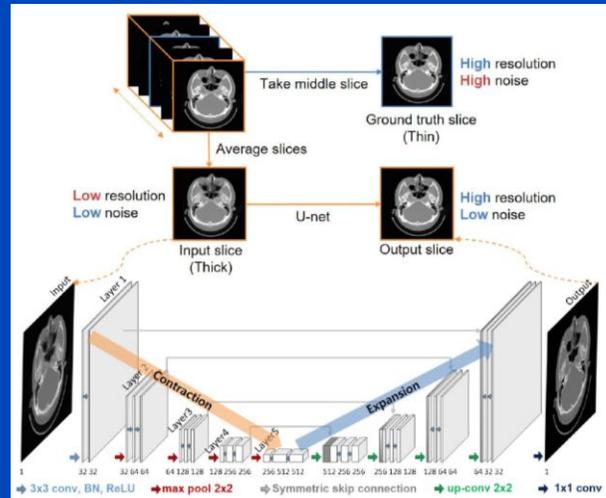

C = 50 HU, W = 1200 HU

Super resolution does not add new information.

**SPATIAL RESOLUTION IMPROVEMENT**

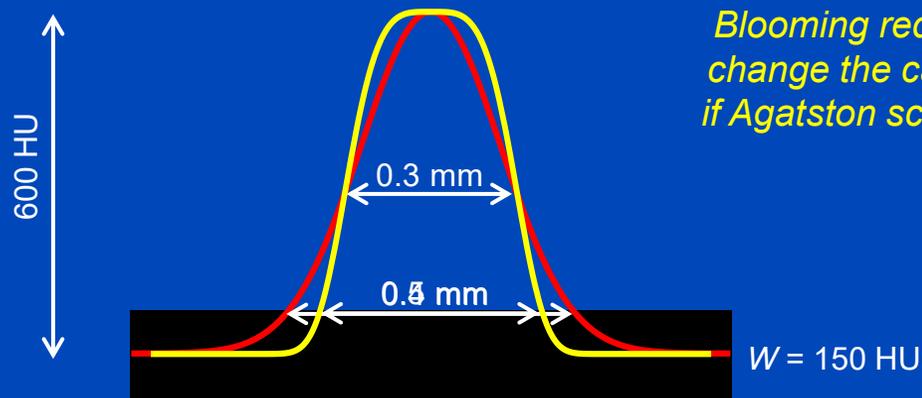

# Resolution Improvement Example

- 2D U-net to converts 5 mm thick images into 1 mm ones.
- E.g. to “replace a scanning protocol for a 1 mm slice with a 5 mm protocol”.

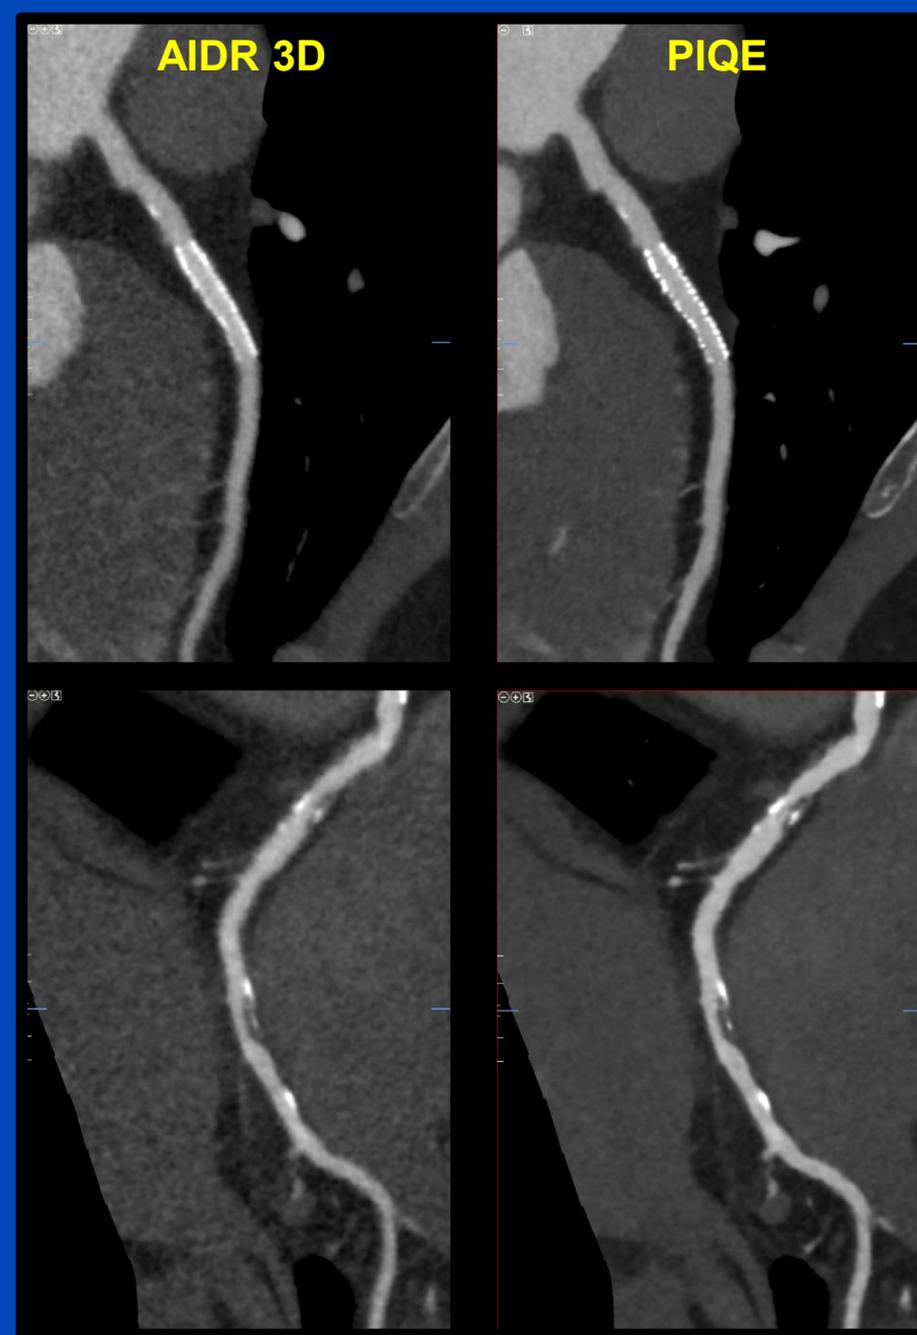

# Canon PIQE

- Precise IQ Engine (PIQE).
- Trained on data from Canon's Precision high spatial resolution CT
- Converts images from Canon's standard spatial resolution scanners (e.g. Aquilion ONE / PRISM edition) to look like high spatial resolution images.

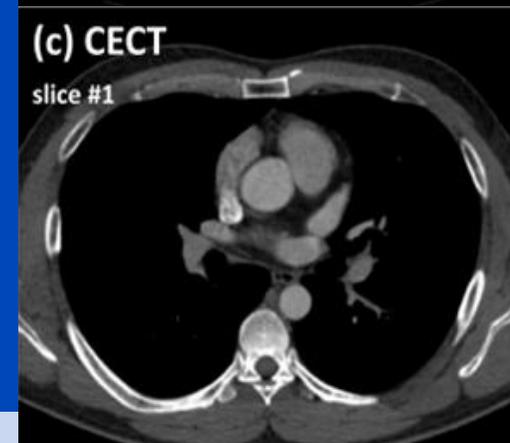

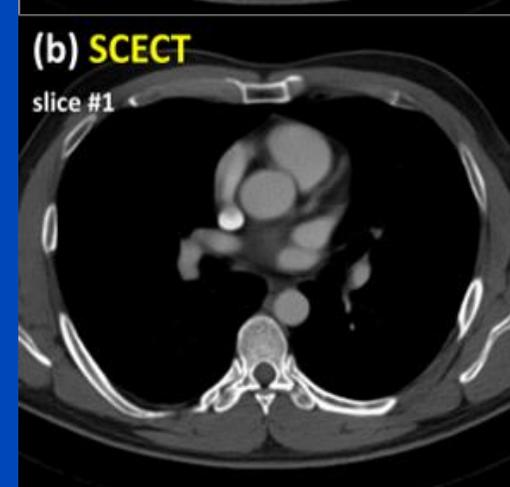

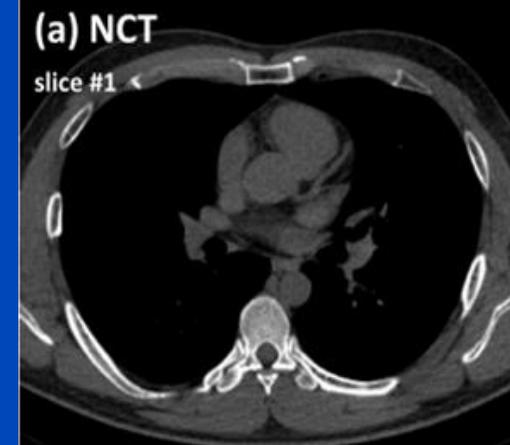

*Warning:  
Blooming reduction might  
change the calcium score,  
if Agatston scoring is used.*

# Fake Contrast Enhancement

# Noise Reduction: GE's True Fidelity

- Based on a deep CNN
- Trained to restore low-dose CT data to match the properties of high quality FBP datasets.
- Said to preserve noise texture and NPS

The 20 cm water phantom (GE Healthcare, WI, US) was scanned on Revolution CT with two CTDIvol levels: 4.9mGy and 15.1mGy, and 2.5 mm thick images were reconstructed using FBP, ASiR-V 100% and DLIR-H (Fig. 11a). ASiR-V 100% and DLIR-H were selected for the highest potential visible change in image texture relative to the FBP reference at higher dose, for a challenging setup to compare the impact of the iterative reconstruction and deep-learning technologies on image appearance. The normalized NPS curves (Fig. 11b) show that images of low-dose DLIR have the same NPS characteristics as the images of high-dose FBP, whereas iterative reconstruction produces results that are clearly different.

Medical Physics

# Motivation

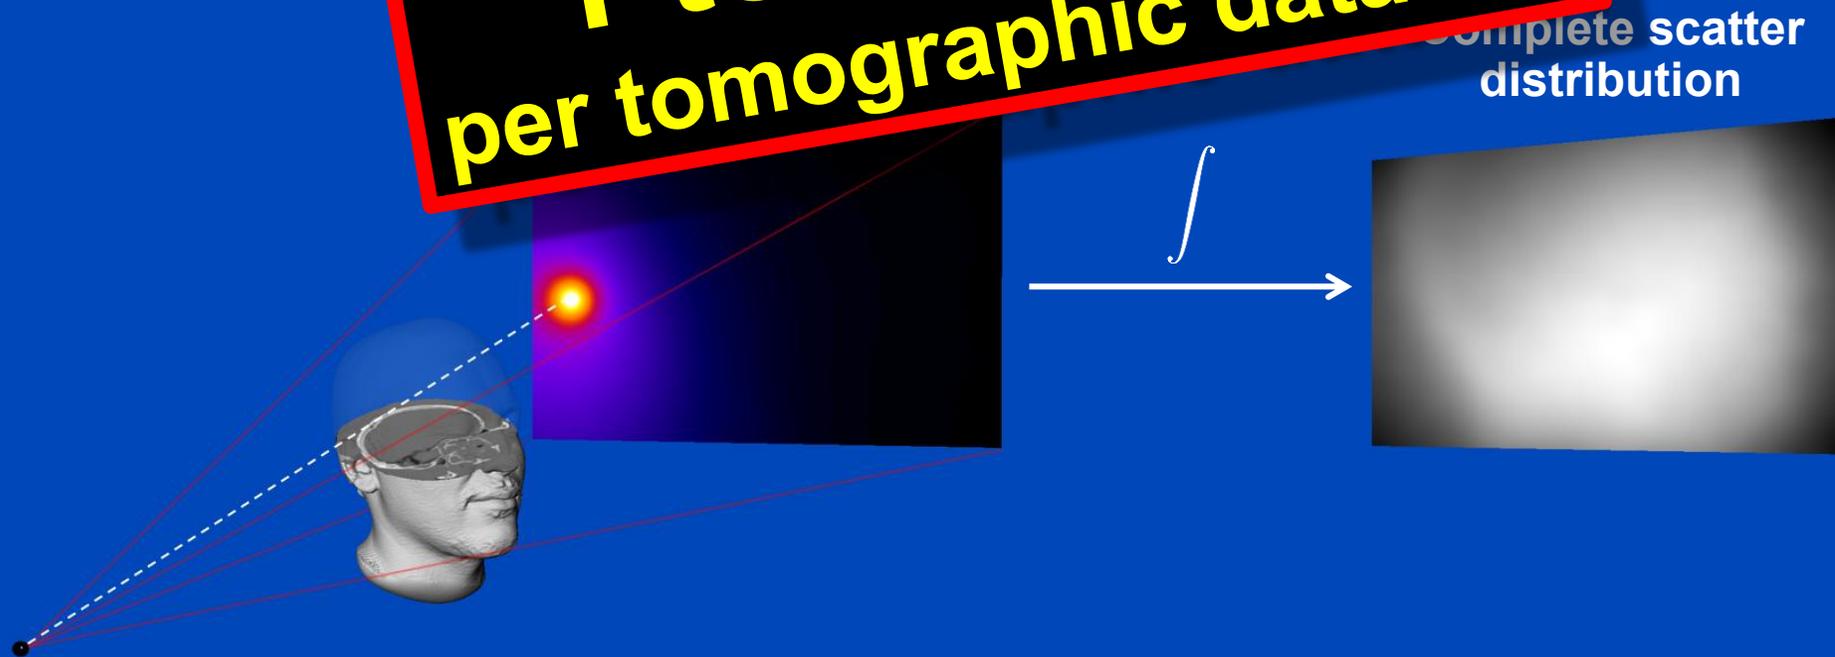

- X-ray scatter is a major cause of artifacts in CT and CBCT.
- Appropriate scatter correction is crucial to maintain the diagnostic value of the CT examination.

# Monte Carlo Scatter Estimation

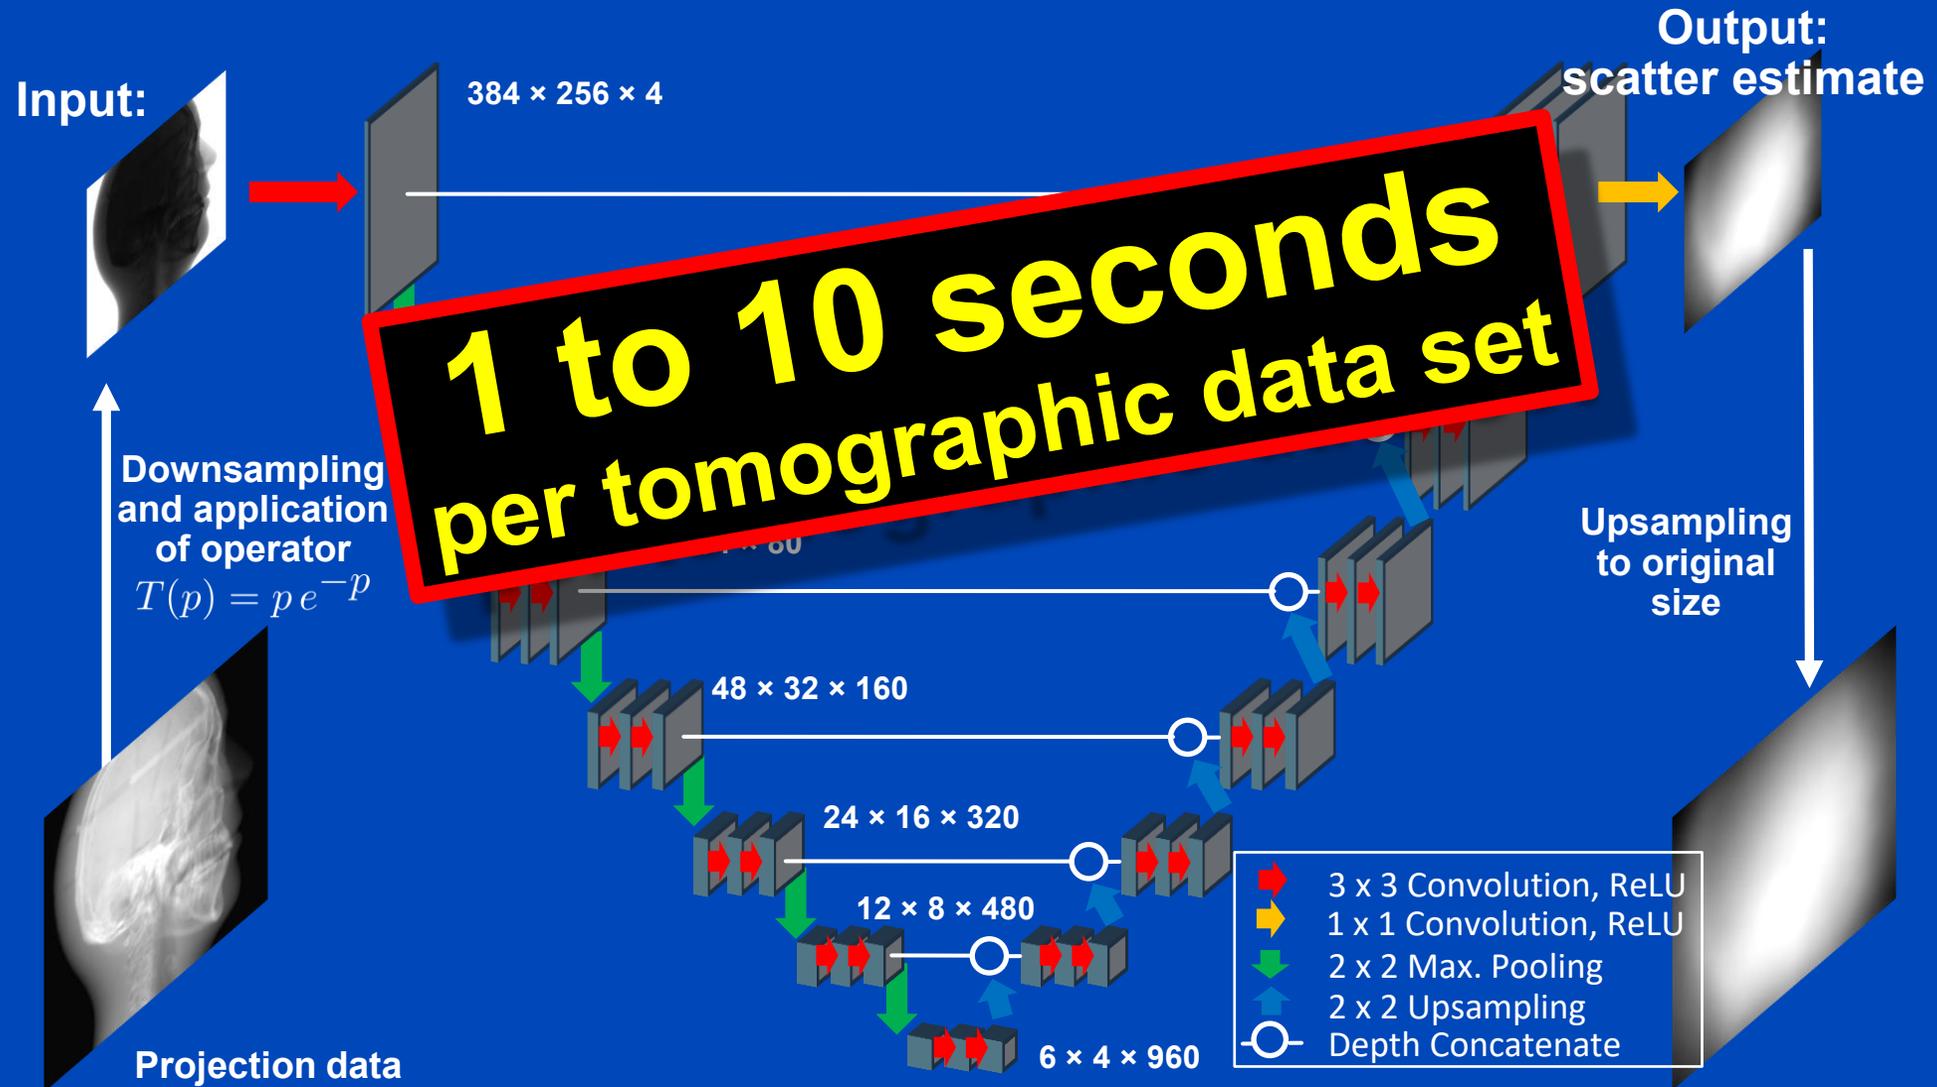

- Simulation of photon trajectories according to physical interaction probabilities.
- Simulating a large number of photons  $N$  approximates the actual scatter distribution.

**1 to 10 hours  
per tomographic data set**

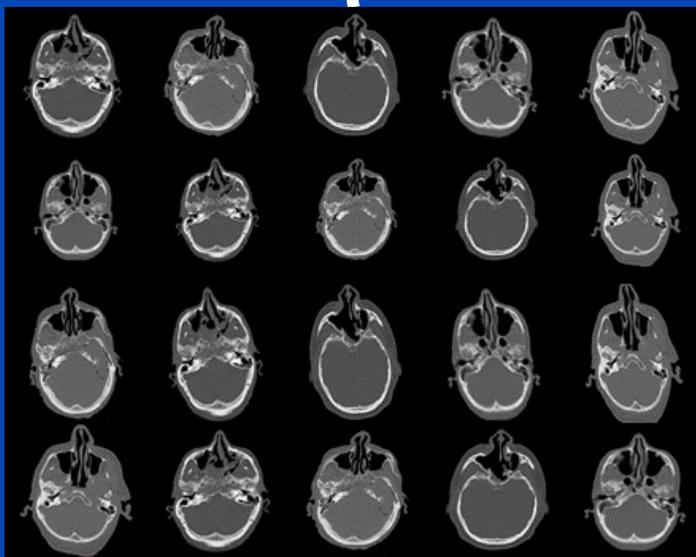

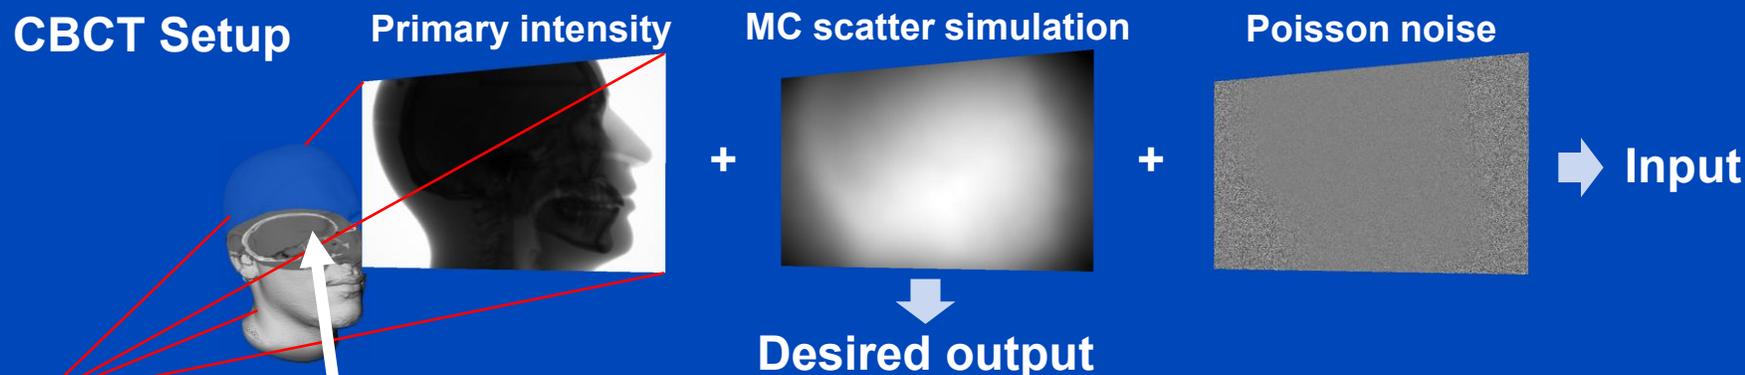

# Deep Scatter Estimation

## Network architecture & scatter estimation framework

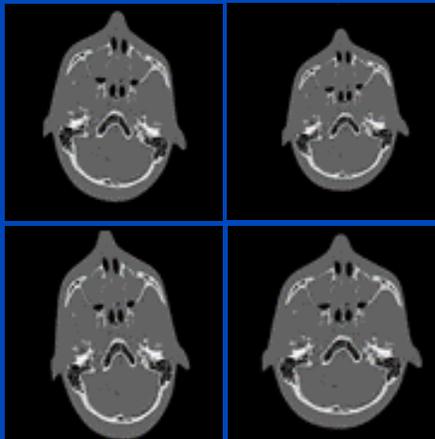

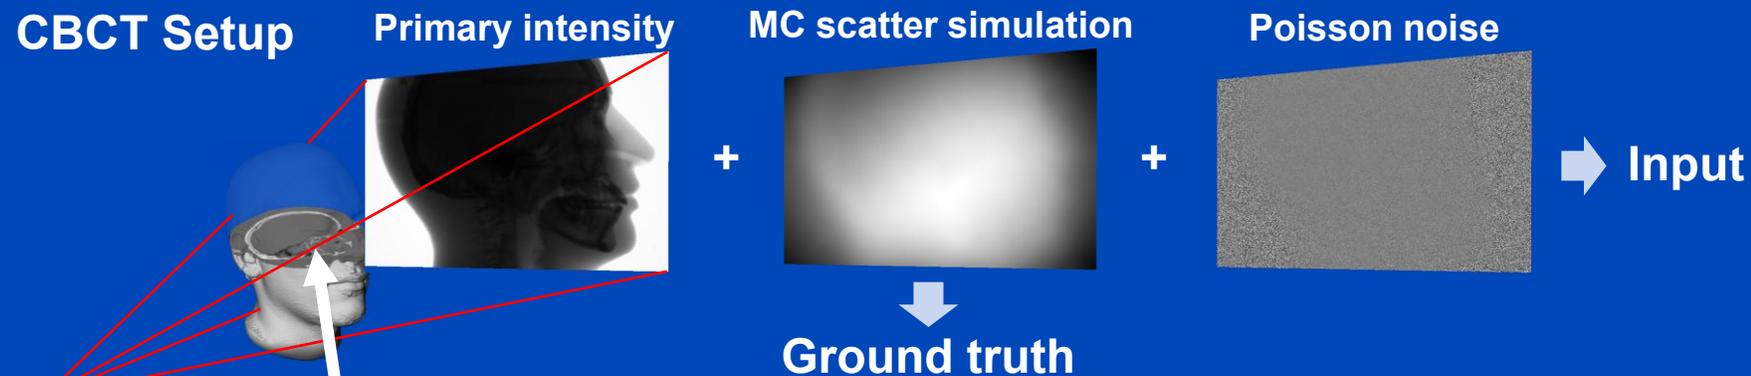

# Training the DSE Network

- **Simulation of 6000 projections using different heads and acquisition parameters (80 kV, ..., 140 kV in steps of 20 kV).**
- **Splitting into 80% training and 20% validation data.**
- **Mean  $S/P = 0.9$**
- **90<sup>th</sup> percentile  $S/P = 1.32$**
- **Training minimizes MSE pixel-wise loss on a GeForce GTX 1080 for 80 epochs.**

# Testing of the DSE Network for Simulated Data (at 120 kV)

- Application of the DSE network to predict scatter for simulated data of a head (different from training data).

# Results on Simulated Projection Data

	Primary intensity	Scatter ground truth (GT)	(Kernel - GT) / GT	(Hybrid - GT) / GT	(DSE - GT) / GT
View #1			<b>14.1%</b> mean absolute percentage error over all projections	<b>7.2%</b> mean absolute percentage error over all projections	<b>1.2%</b> mean absolute percentage error over all projections

# Reconstructions of Simulated Data

$C = 0 \text{ HU}, W = 1000 \text{ HU}$

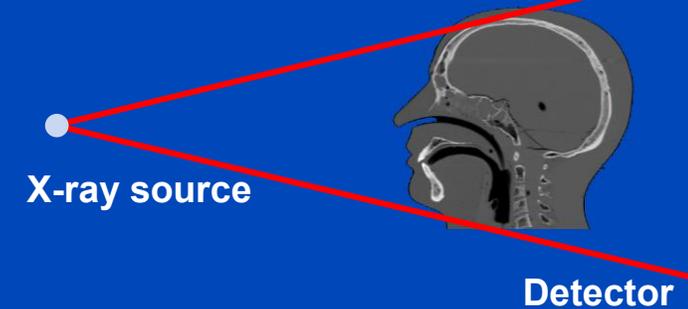

# Testing of the DSE Network for Measured Data (120 kV)

DKFZ table-top CT

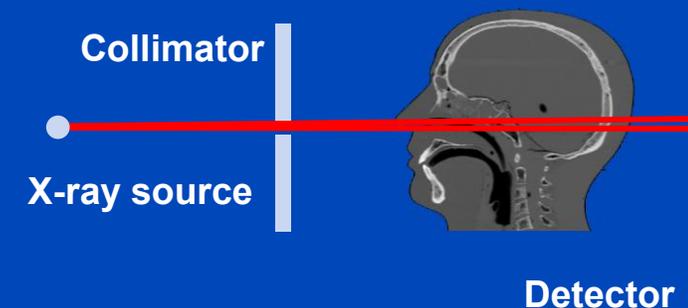

- Measurement of a head phantom at our in-house table-top CT.
- Slit scan measurement serves as ground truth.

Measurement to be corrected

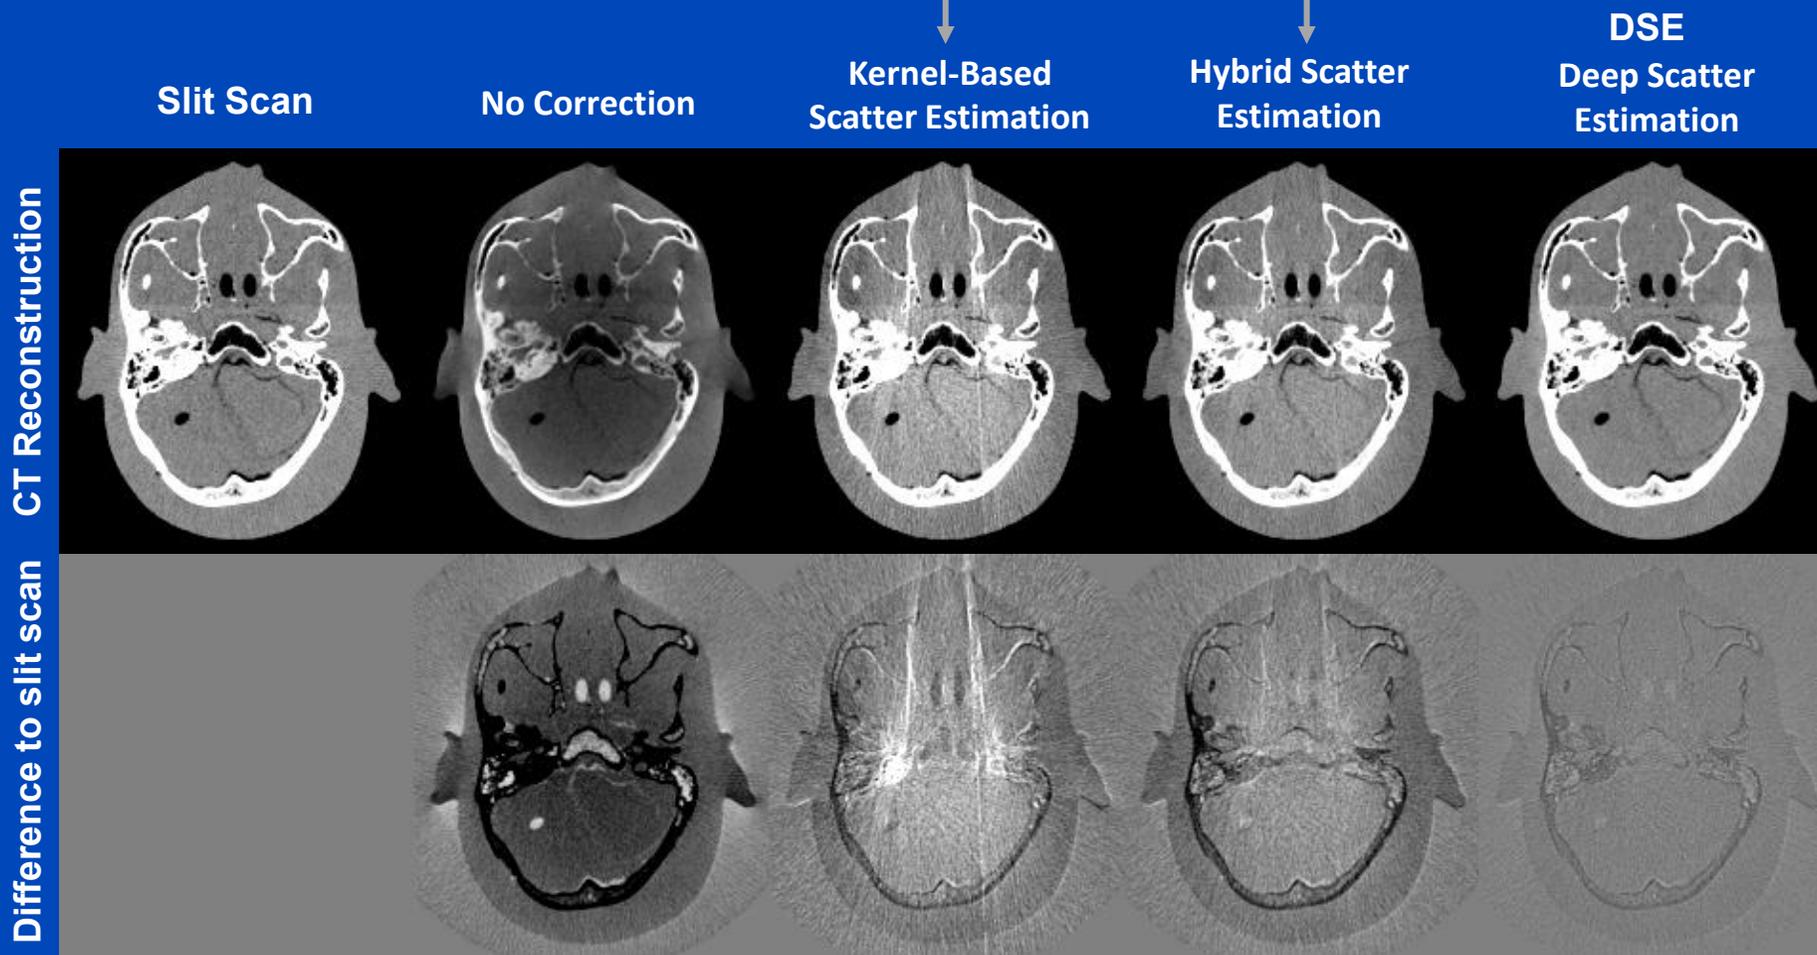

Ground truth: slit scan

# Reconstructions of Measured Data

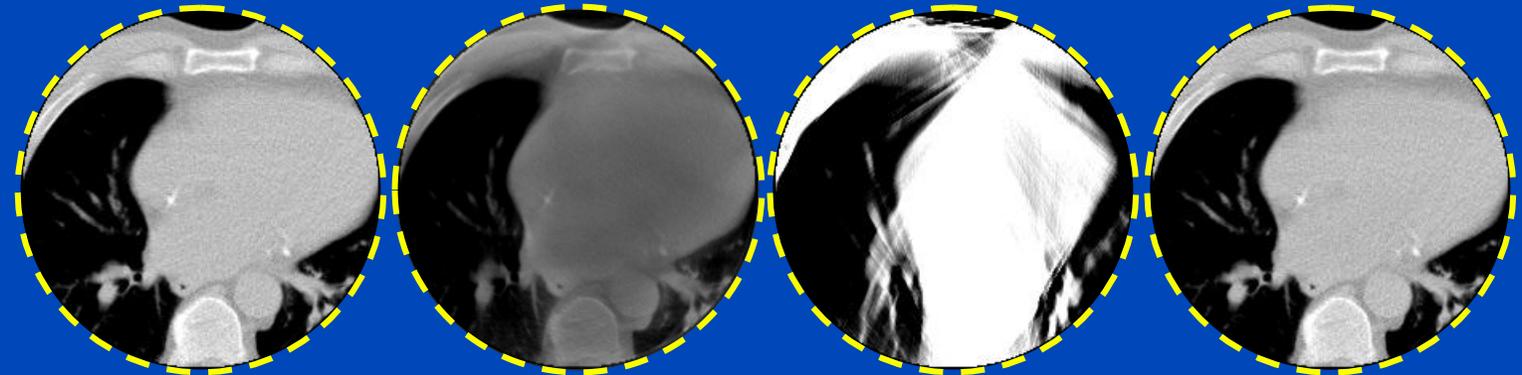

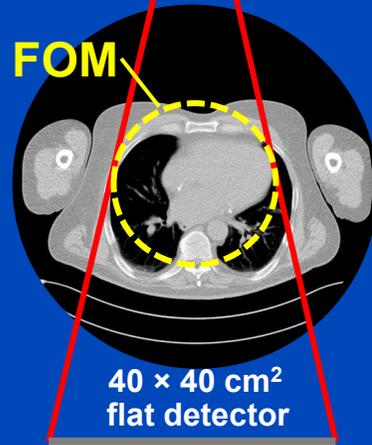

Parameters of the two comparison methods trained in the same way as those of DSE: same data, same loss function, same optimization algorithm.

$C = 0 \text{ HU}$ ,  $W = 1000 \text{ HU}$

A simple detruncation was applied to the rawdata before reconstruction. Images were clipped to the FOM before display.  $C = -200$  HU,  $W = 1000$  HU.

# Truncated DSE

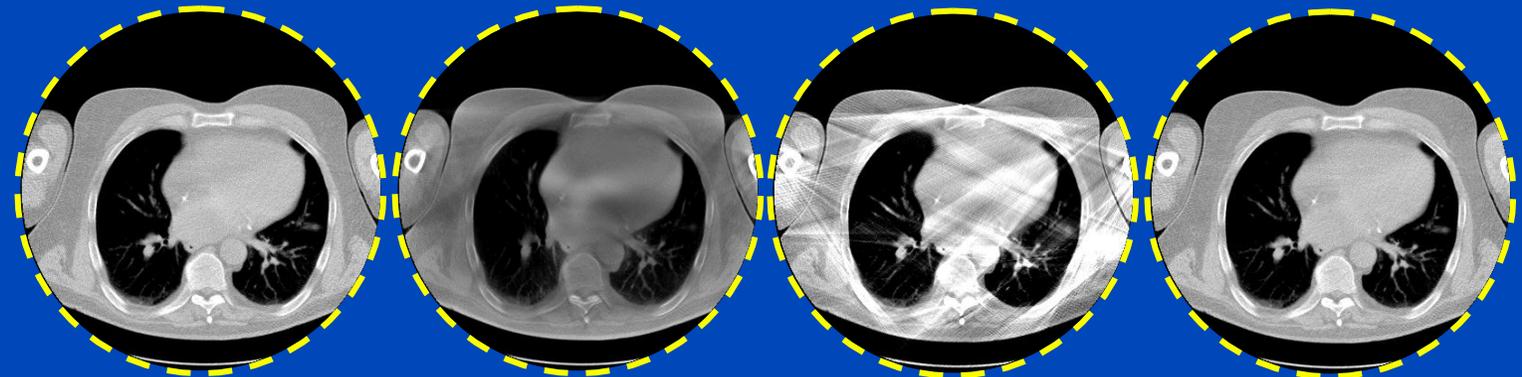

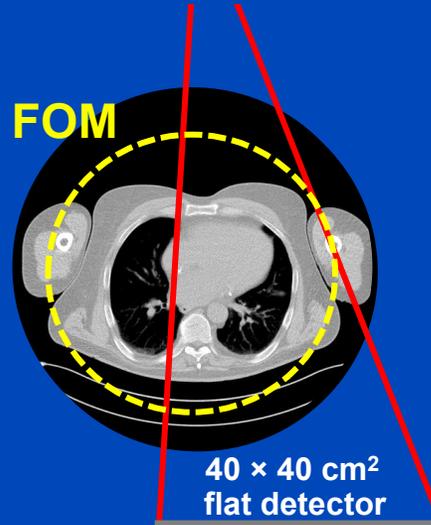

Ground truth

Uncorrected

MC-corrected

DSE

To learn why MC fails at truncated data and what significant efforts are necessary to cope with that situation see [Kachelrieß et al. Effect of detruncation on the accuracy of MC-based scatter estimation in truncated CBCT. Med. Phys. 45(8):3574-3590, August 2018].

# Does DSE Generalize to Different Anatomical Regions?

- **DSE:**

<b>DSE</b>	Head	Thorax	Abdomen
Head	1.2	21.1	32.7
Thorax	8.8	1.5	9.1
Abdomen	11.9	10.9	1.3
All data	1.8	1.4	1.4

Values shown are the mean absolute percentage errors (MAPEs) of the testing data.  
Note that thorax and head suffer from truncation due to the small size of the 40×30 cm flat detector.

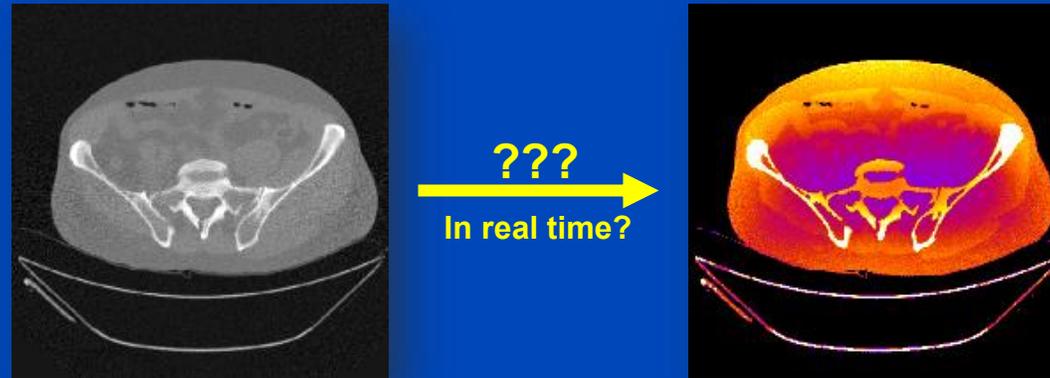

- **KSE** (“trained” using the same data):

<b>KSE</b>	Head	Thorax	Abdomen
Head	14.5	26.8	32.5
Thorax	16.2	18.5	19.4
Abdomen	16.8	22.1	17.8
All data	14.9	20.5	19.3

# Conclusions on DSE

- DSE needs about 3 ms per CT and 10 ms per CBCT projection (as of 2020).
- DSE is a fast and accurate alternative to MC simulations.
- DSE outperforms kernel-based approaches in terms of accuracy and speed.
- Facts:
  - DSE can estimate scatter from a single (!) x-ray image.
  - DSE can accurately estimate scatter from a primary+scatter image.
  - DSE generalizes to all anatomical regions.
  - DSE works for geometries and beam qualities differing from training.
  - DSE may outperform MC even though DSE is trained with MC.
- DSE is not restricted to reproducing MC scatter estimates.
- DSE can rather be trained with any other scatter estimate, including those based on measurements.

Grant/Award Number: KA 1678/24

**Abstract**

**Purpose:** With the rising number of computed tomography (CT) examinations and the trend toward personalized medicine, patient-specific dose estimates are becoming more and more important in CT imaging. However, current approaches are often too slow or too inaccurate to be applied routinely. Therefore, we propose the so-called deep dose estimation (DDE) to provide highly accurate patient dose distributions in real time

**Methods:** To combine accuracy and computational performance, the DDE algorithm uses a deep convolutional neural network to predict patient dose distributions. To do so, a U-net like architecture is trained to reproduce Monte Carlo simulations from a two-channel input consisting of a CT reconstruction and a

# Why Dose Distributions?

- **Useful to study dose reduction techniques**
  - Tube current modulation
  - Prefiltration and shaped filtration
  - Tube voltage settings
  - ...
- **Useful to estimate patient dose**
  - Risk assessment requires segmentation of the organs
  - Often semiantropomorphic patient models take over
  - The infamous k-factors that convert DLP into  $D_{\text{eff}}$  are derived this way, e.g.  $k_{\text{chest}} = 0.014 \text{ mSv/mGy/cm}$
  - ...
- **Useful for patient-specific CT scan protocol optimization**
- **However: Dose estimation is often said not to work in real time.**

# Classical Patient-Specific Dose Estimation

- **Accurate solutions:**
  - Monte Carlo (MC) simulation<sup>1</sup>, **gold standard**, stochastic LBTE solver
  - Analytic linear Boltzmann transport equation (LBTE) solver<sup>2</sup>
    - **Accurate but computationally expensive**
- **Fast alternatives:**
  - Application of patient-specific conversion factors to the DLP<sup>3</sup>.
  - Application of look-up tables using MC simulations of phantoms<sup>4</sup>.
  - Analytic approximation of CT dose deposition<sup>5</sup>.
    - **Fast but less accurate**

<sup>5</sup>B. De Man, “Dose reconstruction for real-time patient-specific dose estimation in CT”, Med. Phys. 42, 2015.

# Motivation

- The potential risk of ionizing radiation makes dose assessment an important issue in CT imaging.
- Limitation of common metrics (e.g.  $CTDI_w$ ,  $CTDI_{vol}$ , DLP, k-factor, SSDE, ...) to provide information on organ or patient dose.

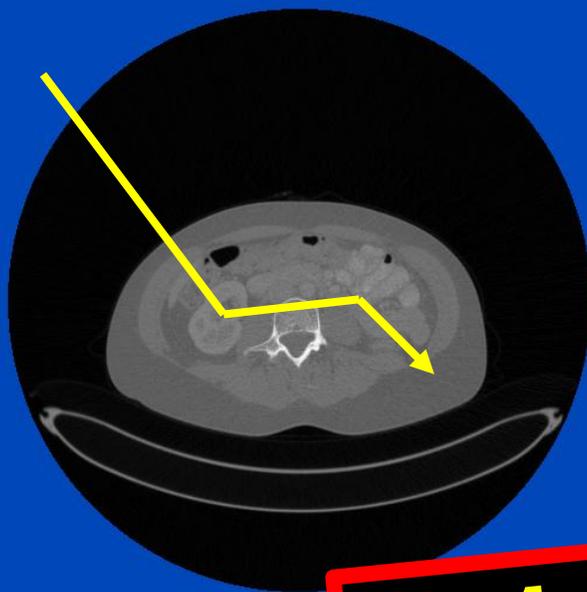

Same CTDI, but different dose distribution

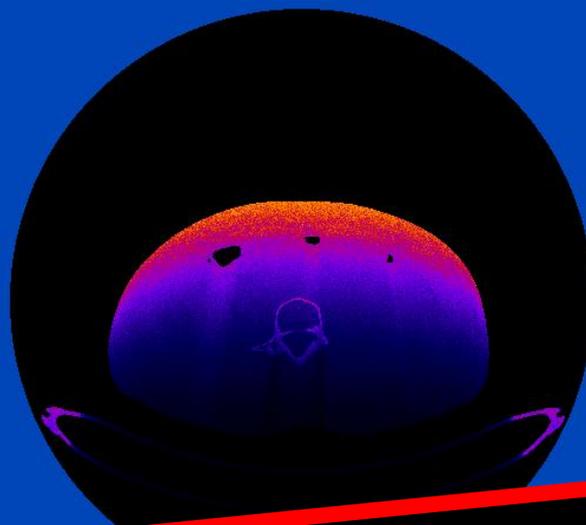

Dose values in air voxels are set to zero (black) in this presentation.

# MC Dose Simulation for a 360° Scan

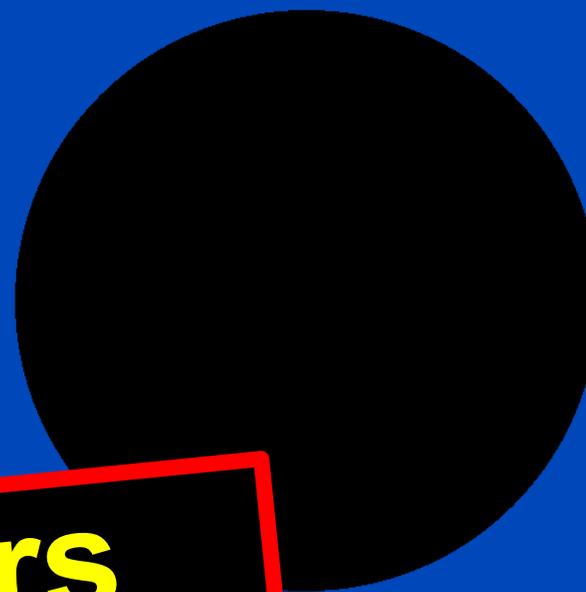

Patient

Dose per Projection

Cumulative Dose

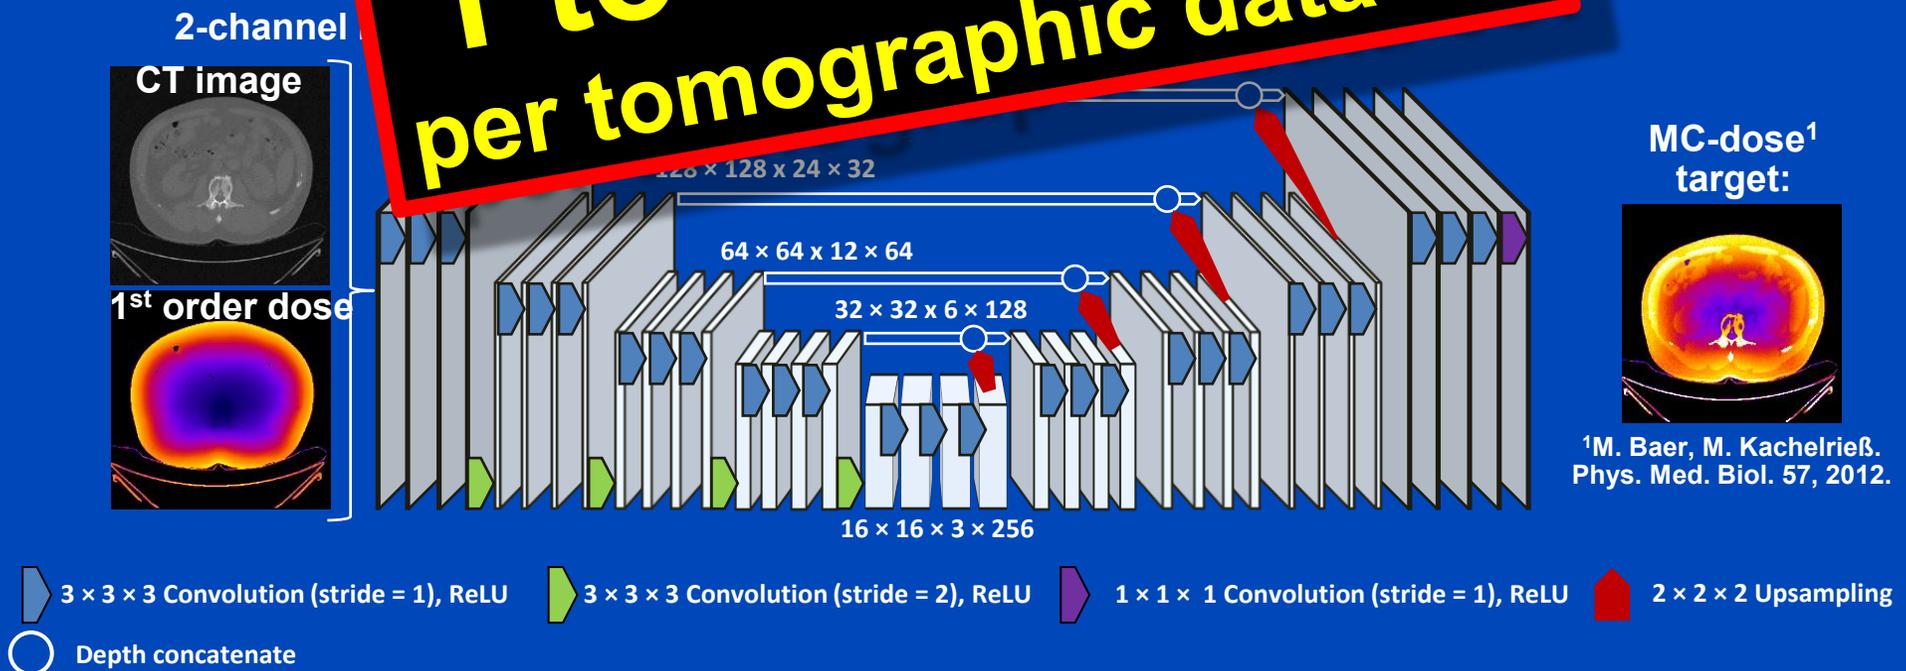

**1 to 10 hours  
per tomographic data set**

# Deep Dose Estimation (DDE)

- Combine fast and accurate CT dose estimation using a deep convolutional neural network.
- Train the network to reproduce MC-dose given the CT image and a first-order dose.

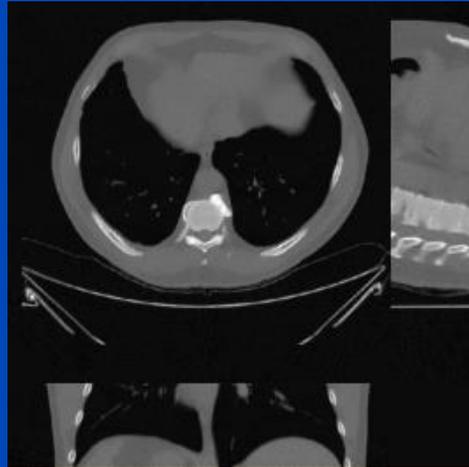

**1 to 10 seconds per tomographic data set**

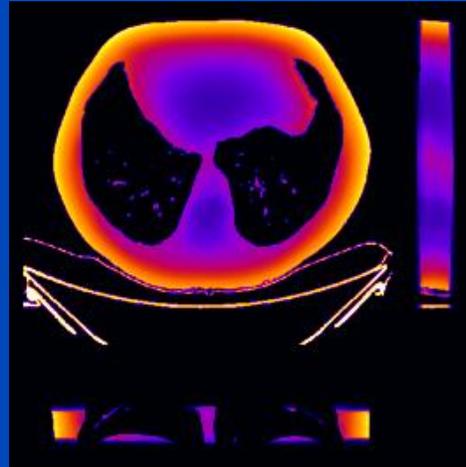

# Results

Thorax, tube A, 120 kV, no bowtie

CT image

First order dose

	MC	DDE
48 slices	1 h	0.25 s
whole body	20 h	5 s

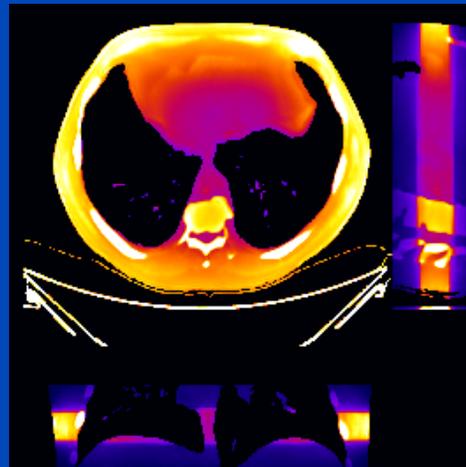

MC uses 16 CPU kernels  
DDE uses one Nvidia Quadro P600 GPU

DDE training took 74 h for 300 epochs,  
1440 samples, 48 slices per sample

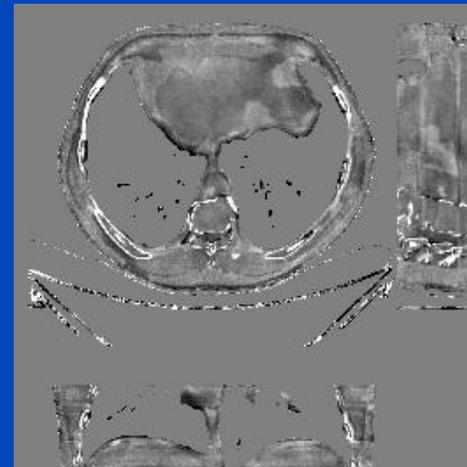

MC ground truth

DDE

Relative error

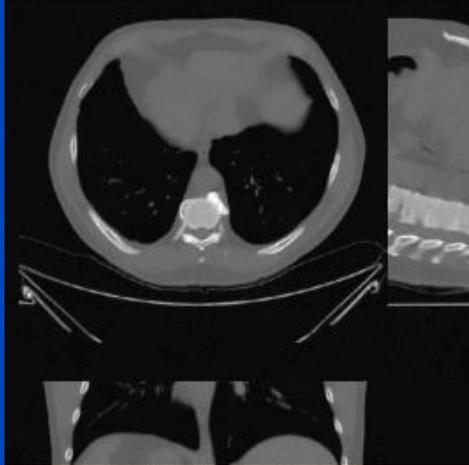

C = 0%  
W = 40%

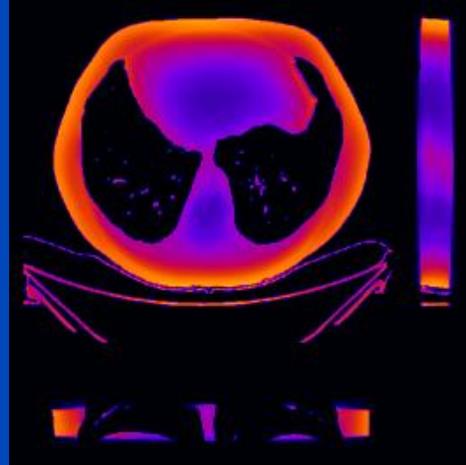

# Results

C = 0%  
W = 40%

# Comments for Practical Use

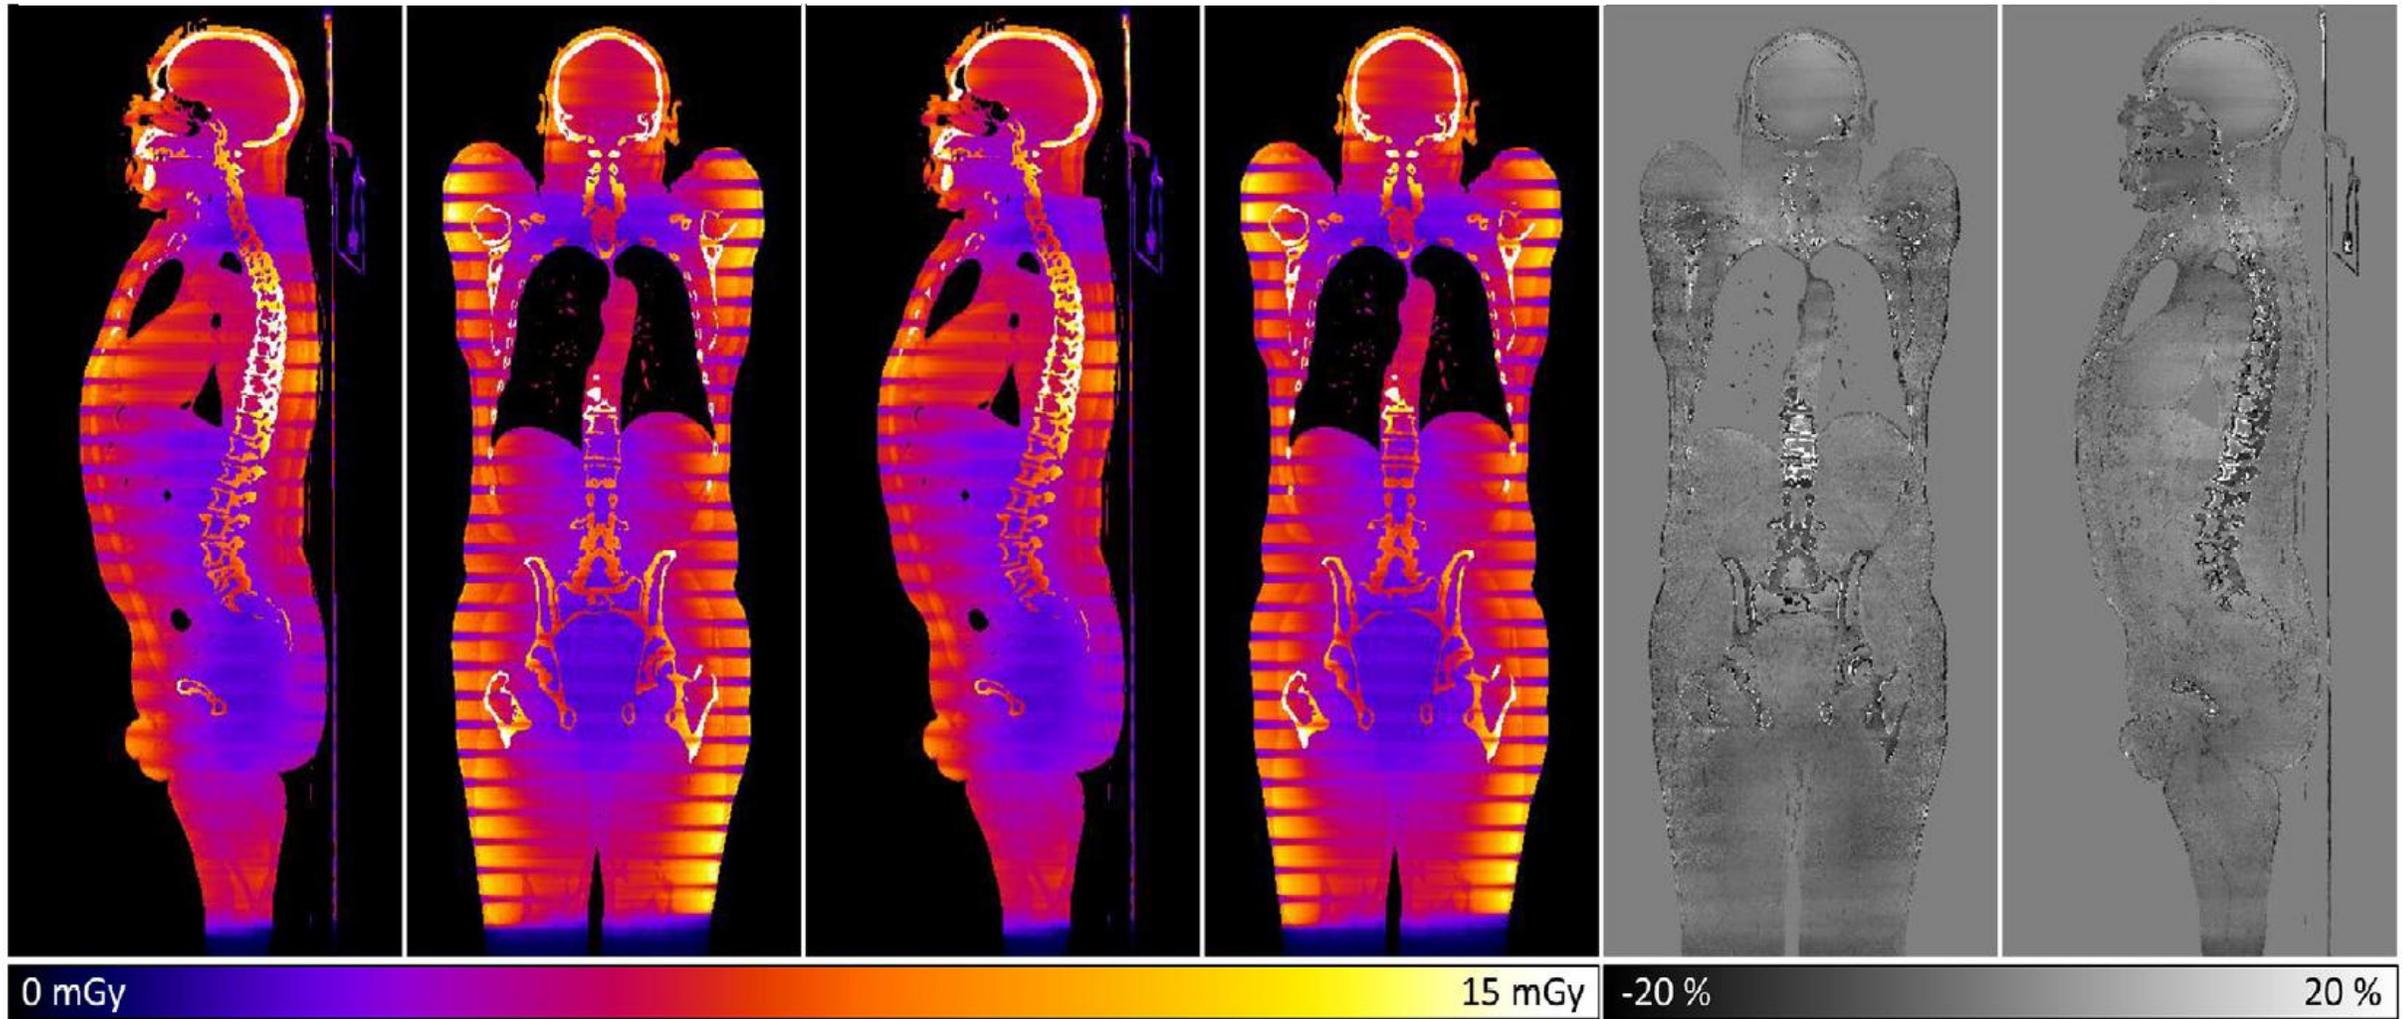

- **DDE needs to use the actual**
  - x-ray spectrum (not available in DICOM)
  - scan trajectory (not available in DICOM)
- **The patient volume**
  - must laterally show the full patient cross-section
  - should longitudinally show the scanned range plus, say, 10 cm at each end.

Monte Carlo (180 min)

Compute times as of 2021

Deep Dose Estimation (2 s)

Percentage Error

**FIGURE 5** Sagittal and coronal view of the dose distribution of a 100 kV whole-body spiral computed tomography (CT) scan including a bowtie filter and an angular tube current modulation. Here, the two left columns show the ground truth, the middle columns show the deep dose estimation (DDE) prediction and the two right columns the corresponding percentage error. Note that dose to air is neglected for computational reasons, and therefore, displayed as zero

# Conclusions on DDE

- **DDE provides accurate dose predictions**
  - for circle scans
  - for sequence scans
  - for partial scans (less than 360°)
  - for limited angle scans (less than 180°)
  - for spiral scans
  - for different tube voltages
  - for scans with and without bowtie filtration
  - for scans with tube current modulation
  - for DSCT scanners, i.e. with large (A) and small (B) detector
- **In practice it may therefore be not necessary to perform separate training runs for these cases.**
- **Thus, accurate real-time patient dose estimation may become feasible with DDE.**

C = 25 HU, W = 400 HU

# Effective Dose Values Relative to mAsTCM

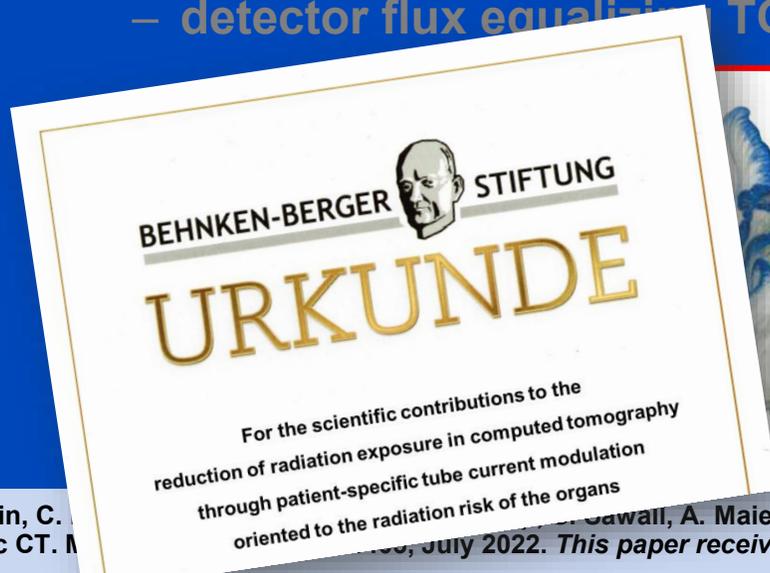

Average over all patients and across all tube voltages (70 to 150 kV)

	noTCM	mAsTCM	riskTCM
Head	110%	100%	92%
Head+Arms	162%	100%	88%
Neck	223%	100%	76%
Thorax	113%	100%	81%
Abdomen	114%	100%	71%
Pelvis	152%	100%	79%

# Conclusions on riskTCM

- Risk-specific TCM minimizes the patient risk.
- With  $D_{\text{eff}}$  as a risk model riskTCM can reduce risk to 30%, compared with the gold standard.
- Other risk models, e.g. organ-specific, weight- and sex-specific models, can be used with riskTCM as well.
- Note:
  - mAsTCM = good for the x-ray tube
  - **riskTCM = good for the patient**
  - detector flux equalizing TCM = good for the detector

**It is up to the vendors to take action!**

# REGISTRATION AND MOCO

# Deep Cosmetic Motion Artifact Reduction

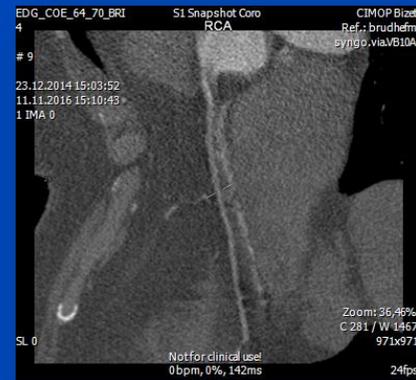

- Image-based correction  
= cosmetic correction  
= similar to pic beauty and others
- May not be the most effective

**Don't do that!  
It's not physical!**

**Stick to estimating  
motion vector  
fields!**

# Deep Cardiac CT MoCo

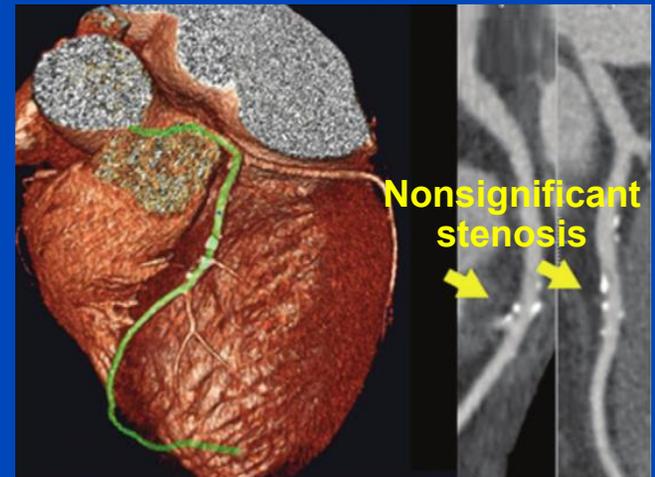

# Motivation

- Cardiac CT imaging is routinely used for the diagnosis of cardiovascular diseases, especially those related to coronary arteries.
- Imaging of coronary arteries places high demands on the spatial and temporal resolution of the CT reconstruction.
- Motion artifacts and image noise may impair the diagnostic value of the CT examination.

CTCA image of the right coronary artery<sup>1</sup>

CTCA image of the left coronary artery<sup>2</sup>

# Deep Respiratory CBCT MoCo

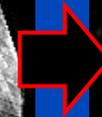

# Yet Unsolved Problems

## Gating and gating-based motion compensation (MoCo)

- require gating signal,
- assume periodic motion,
- have low temporal resolution,
- fail on irregular breathing:

Gating = bad

Gating + MoCo = still bad

# PAMoCo Adaptions for CBCT

- **Consideration of the entire FOM**
  - Estimation of a dense vector field for every voxel within the FOM.
- **Slow rotation speed**
  - Projections can only be grouped into tiny groups (here, no grouping is performed at all)
  - Partial angle reconstruction (PAR)
- **4D output**
  - Estimation of MVF from two arbitrary PARs
  - Similar to Voxelmorph but with PARs
- **Modification of PARs to add morphological context.**

# Deep learning-based cone-beam CT motion compensation with single-view temporal resolution

## Abstract

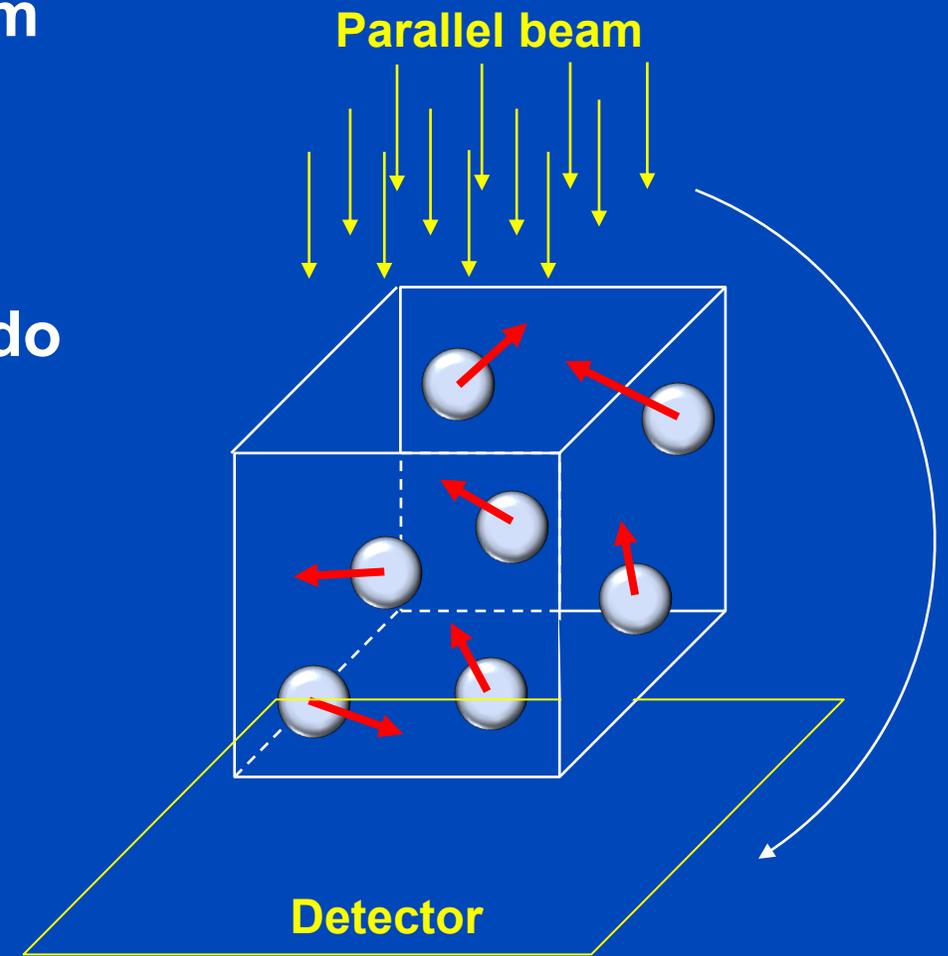

**Background:** Cone-beam CT (CBCT) scans that are affected by motion often require motion compensation to reduce artifacts or to reconstruct 4D (3D+time) representations of the patient. To do so, most existing strategies rely on some sort of gating strategy that sorts the acquired projections into motion bins. Subsequently, these bins can be reconstructed individually before further post-processing may be applied to improve image quality. While this concept is useful for periodic motion patterns, it fails in case of non-periodic motion as observed, for example, in irregularly breathing patients.

**Purpose:** To address this issue and to increase temporal resolution, we propose the deep single angle-based motion compensation (SAMoCo).

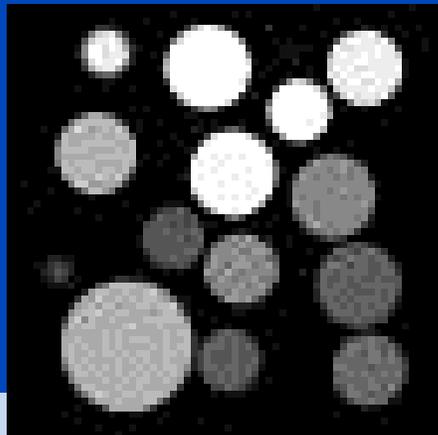

**Methods:** To avoid gating, and therefore its downsides, the deep SAMoCo trains

# Bouncing Spheres

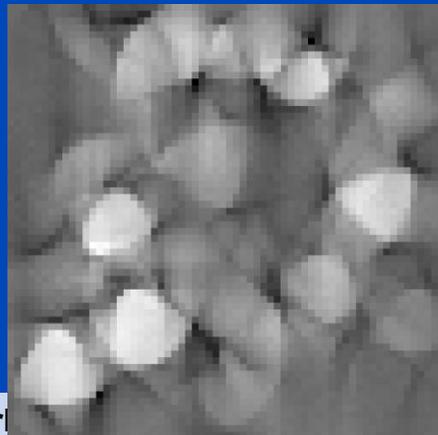

- Spheres with random velocity and random density in a box.
- Elastic collisions with other spheres and walls are elastic.
- 180° scan (180 projections) using a pseudo parallel-beam geometry.
- FDK reconstruction (64×64×32) of single views → 180 PARs.

Slice of prior volume

3D reconstruction

Difference

# Single Angle Reconstructions (SARs)

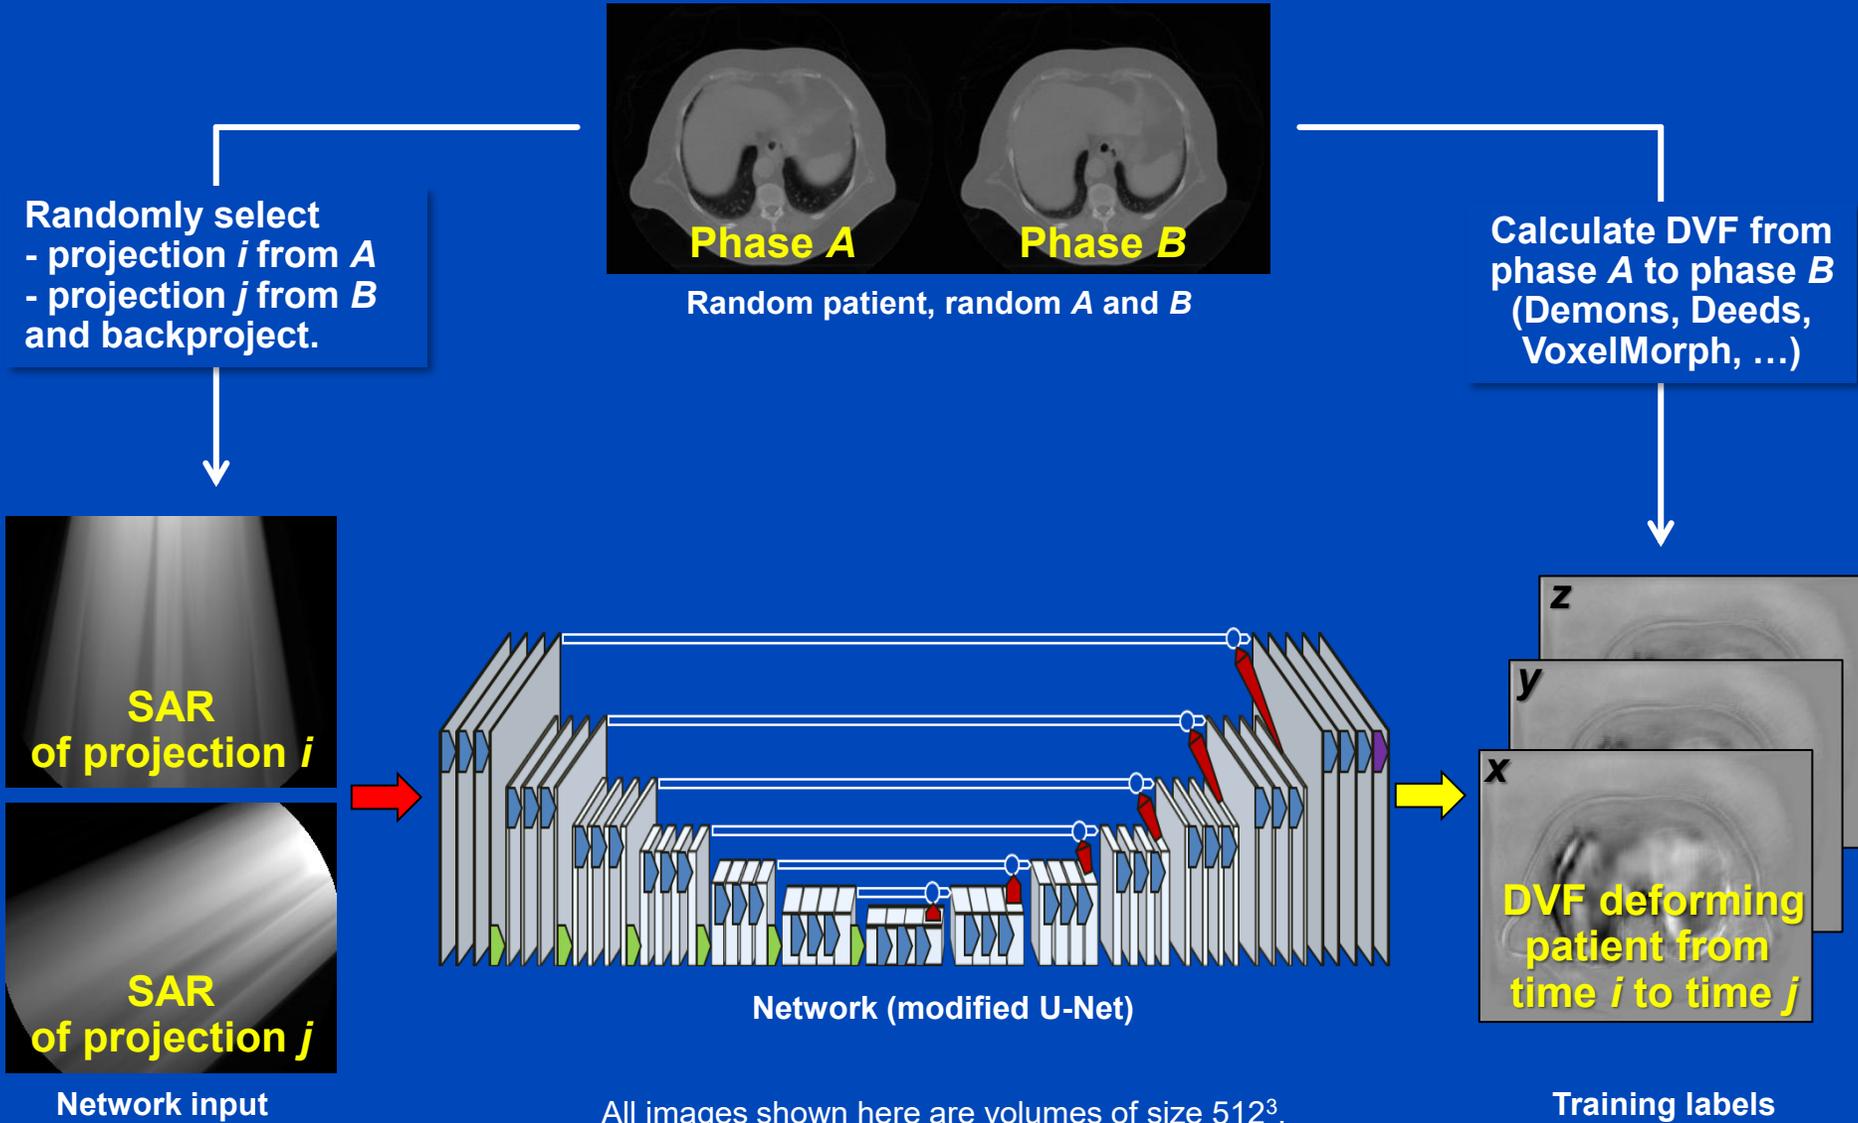

**84 4D CT scans (no artifacts, high temporal resolution)**

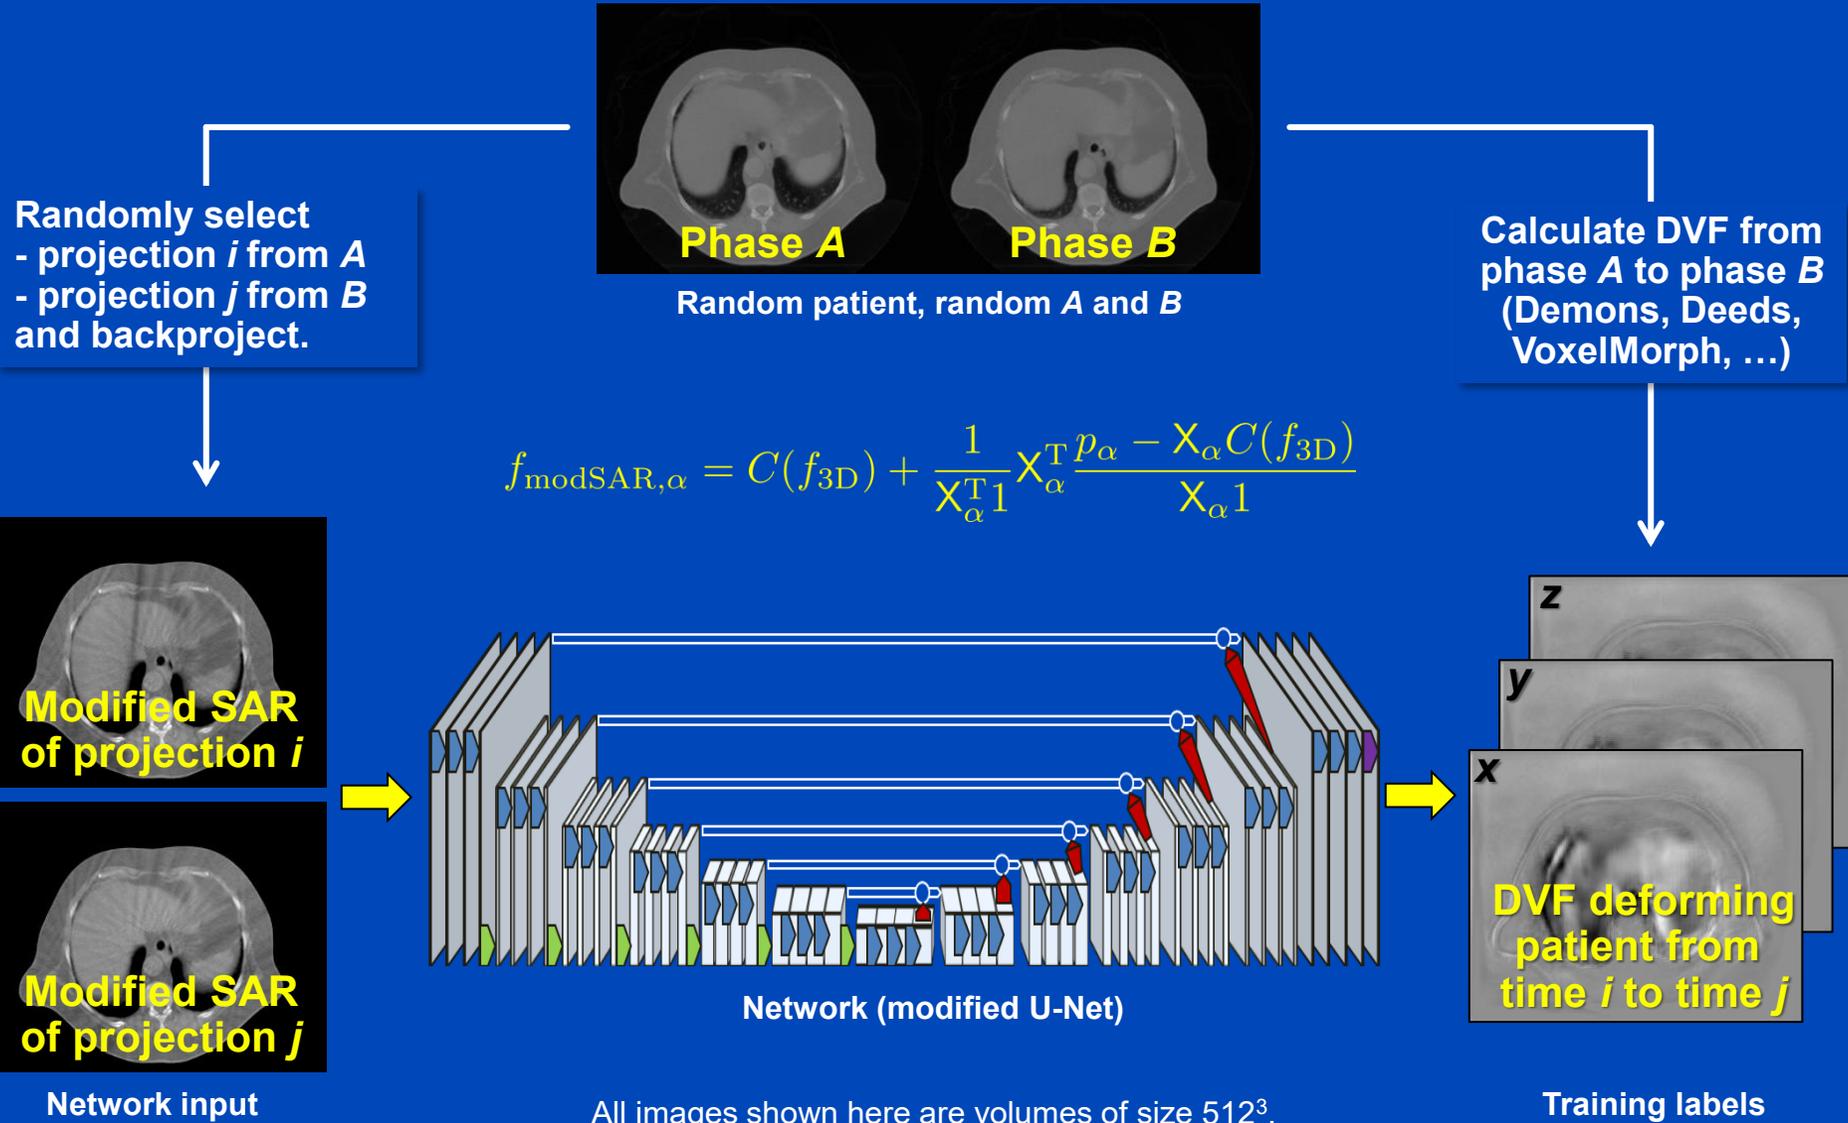

- 10 respiratory phases each (WashU/Colorado dataset)
- 10·10 combinations of phase *A* and *B* possible (including  $A=B$ )
- 84·10·10 displacement vector fields (DVF) known
- 720 CBCT projections<sup>1</sup> simulated for each CT scan (each phase)
- 84·10·720·10·720 projection pairs with known DVF

<sup>1</sup>The actual projection numbers are between 420 and 900 and depend on the scan mode.

# Training Workflow of Deep SAMoCo

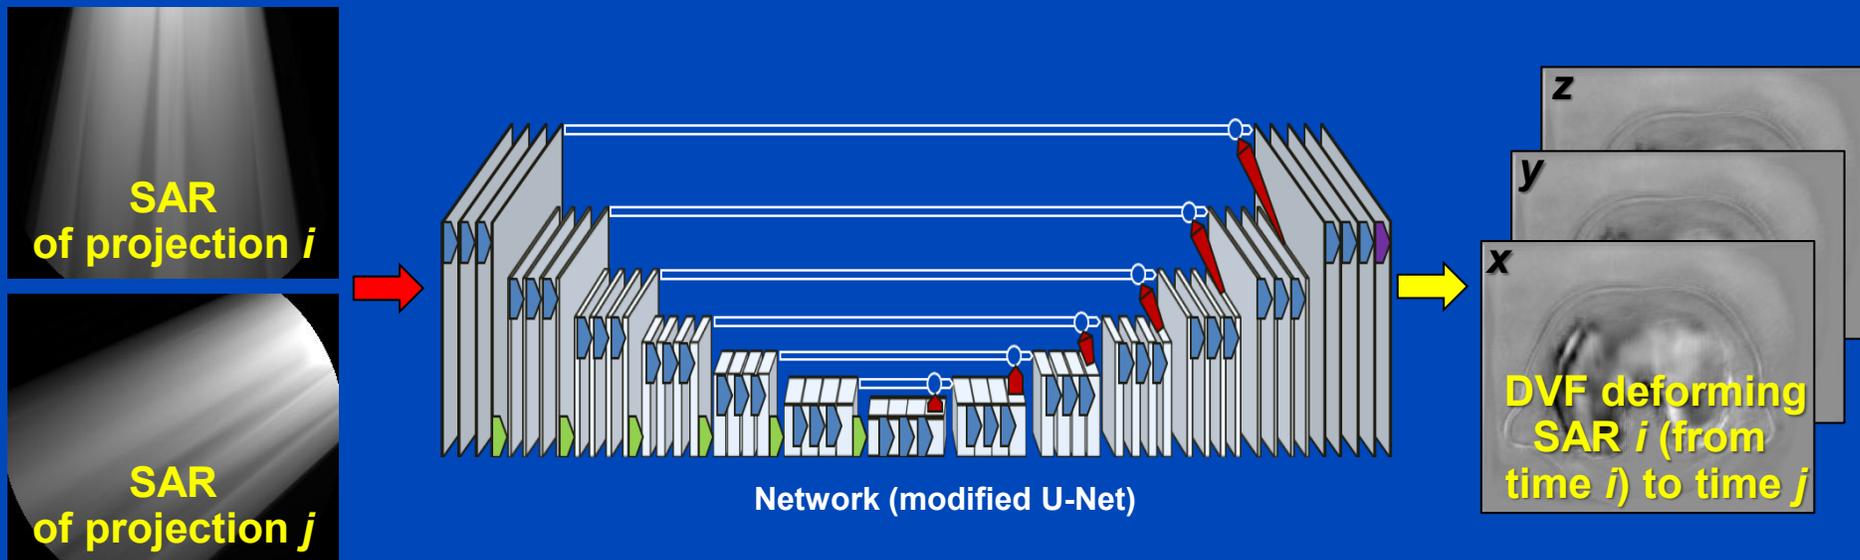

# Training Workflow of Deep SAMoCo

# Inference Workflow of Deep SAMoCo

- For a new patient
  - decide for the desired time point  $j$ , e.g. the one from 1 millisecond ago
  - for all  $i \neq j$  get the DVFs pointing from  $i$  to  $j$  from the neural network
  - deform SARs for all  $i \neq j$  into time point  $j$
  - add all the volumes

For all  $i \neq j$  do

Network input

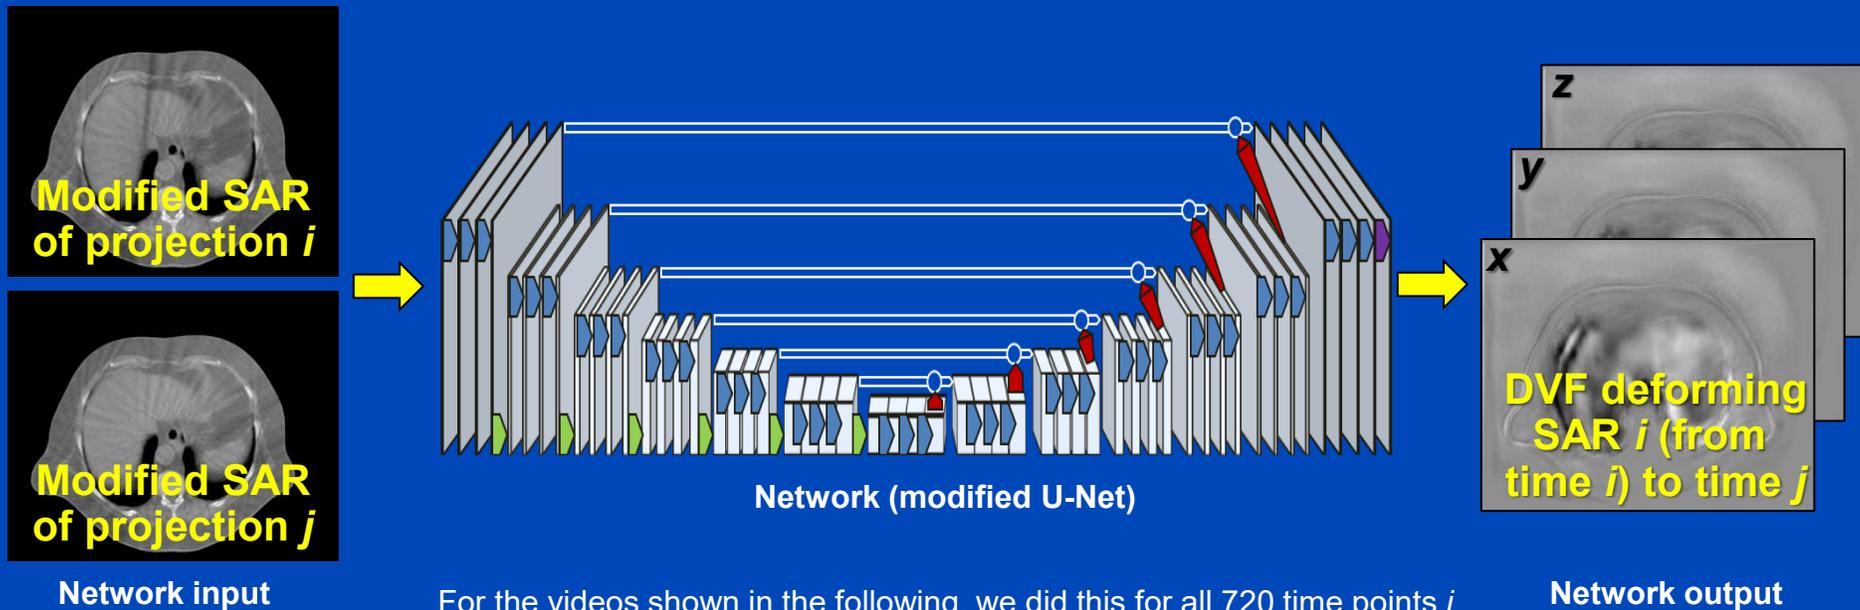

For the videos shown in the following, we did this for all 720 time points  $j$

Network output

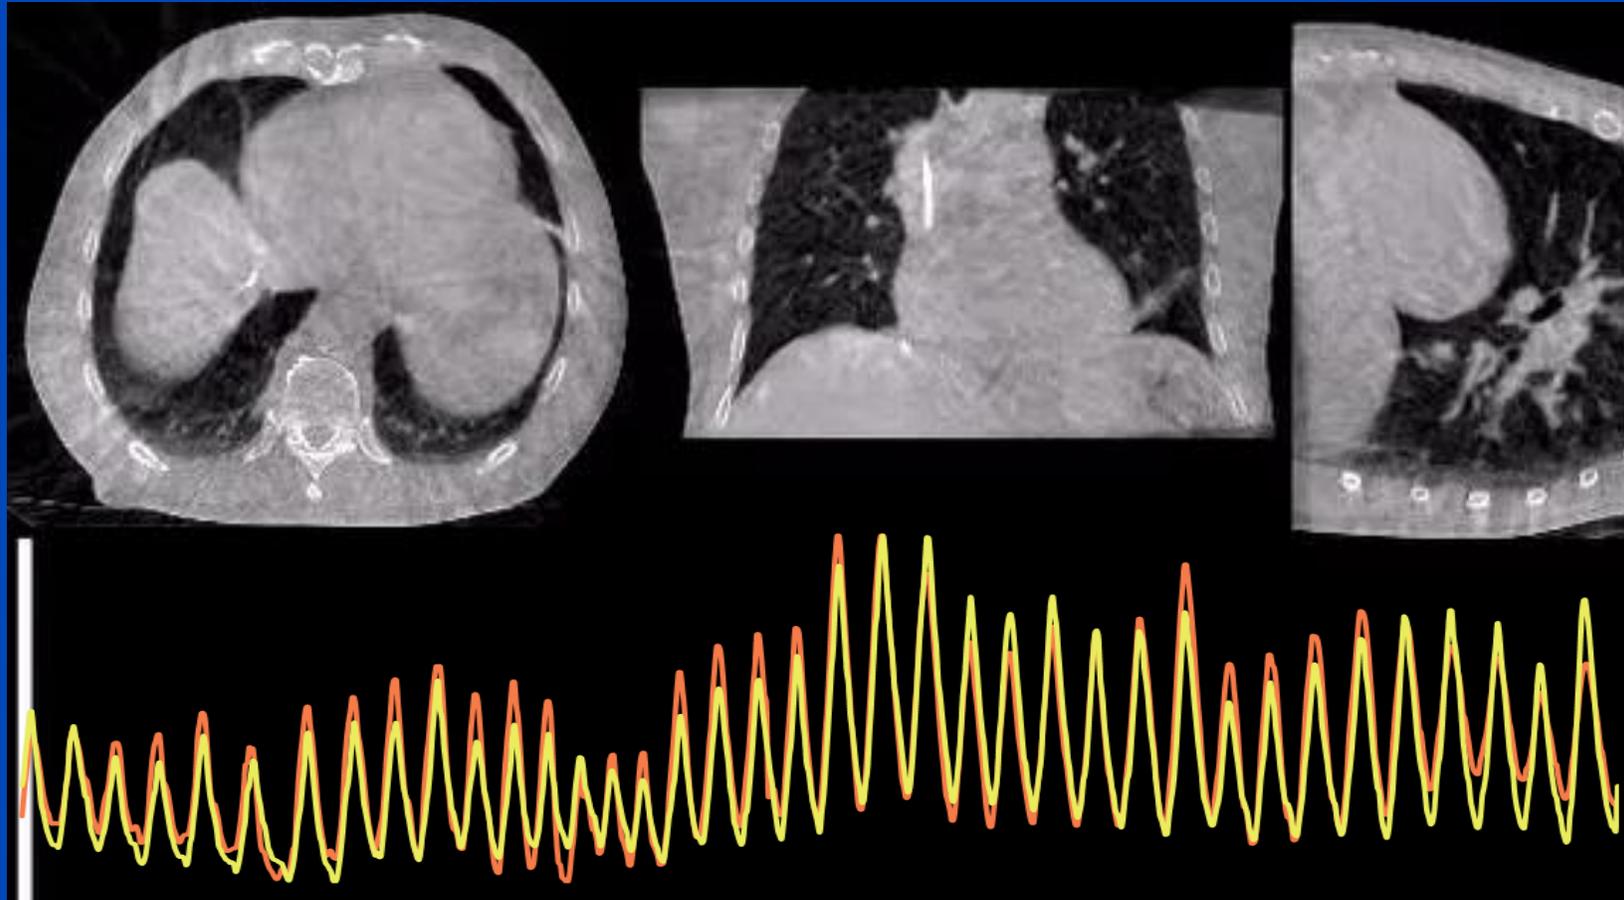

# Inference Workflow of Deep SAMoCo

- For a new patient
  - decide for the desired time point  $j$ , e.g. the one from 1 millisecond ago
  - for all  $i \neq j$  get the DVFs pointing from  $i$  to  $j$  from the neural network
  - deform SARs for all  $i \neq j$  into time point  $j$

# INTERVENTIONAL IMAGING

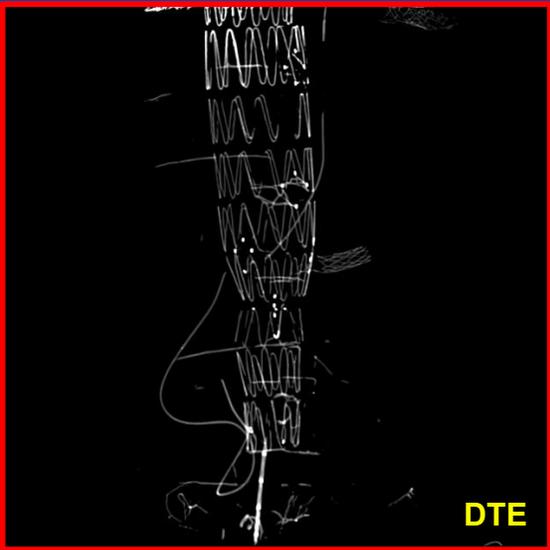

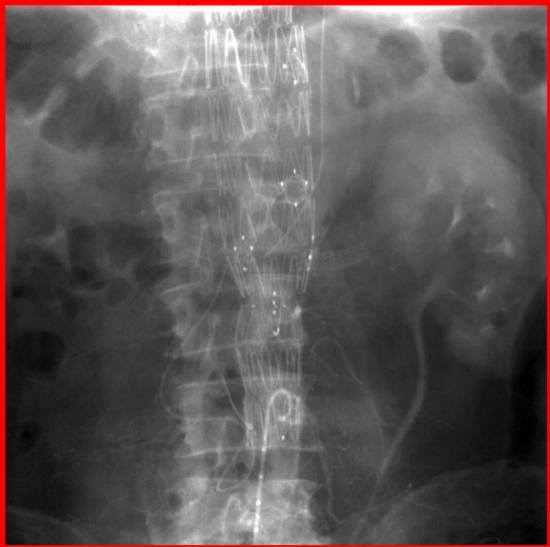

A medical C-arm X-ray machine is shown submerged underwater. A bright light source from above creates a large, shimmering column of light that illuminates the machine and the surrounding water. The machine is positioned in the lower half of the frame, with its curved arm and various components visible. The water is a deep blue color, and the overall scene is dramatic and surreal.

# Digital Subtraction Angiography (DSA)

- **DSA principle:**
  - Before contrast injection acquire a mask image.
  - When injecting contrast, perform fluoroscopy.
  - Display each fluoroscopic image minus the mask image
- **For decades, DSA is used world-wide with great success in many clinical angiographic exams.**
- **Downsides:**
  - Need to start acquisition before injecting the contrast medium
  - Works for only static situations.
- **Future<sup>1,2</sup>:**
  - Use AI to compute DSA without needing the mask image.
  - Do this in real-time (e.g. 5 ms per x-ray image).

# Deep 3D+T Fluoroscopy

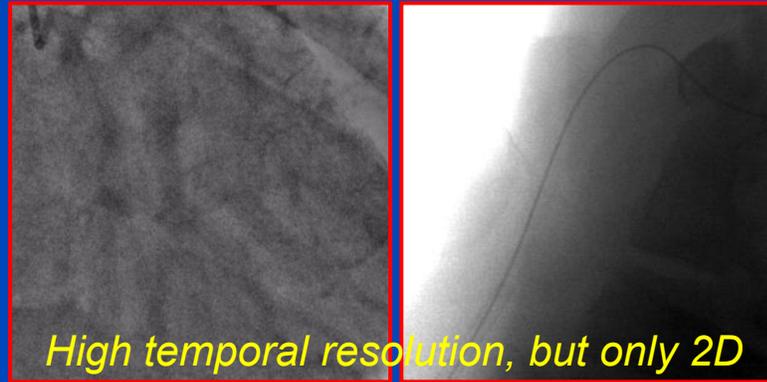

???

At 2D+T dose?

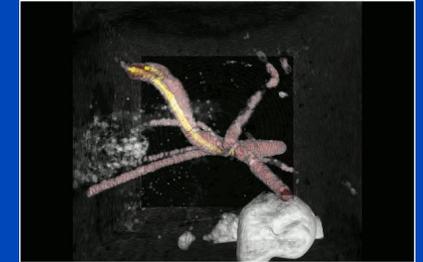

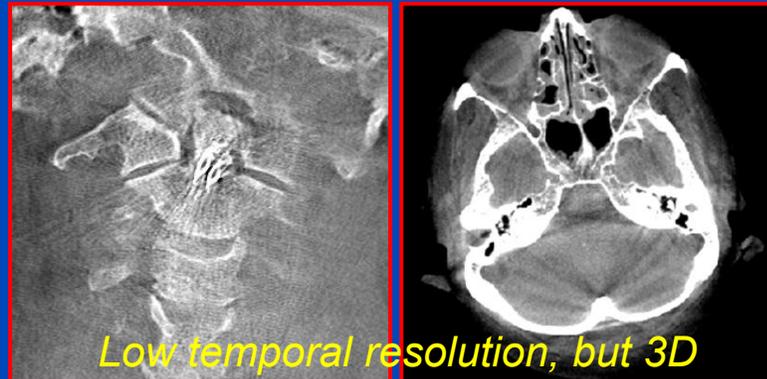

# Deep 3D+T Tomographic Fluoroscopy

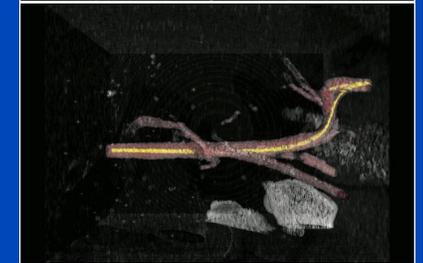

either 2D+T fluoroscopy

or 3D tomography

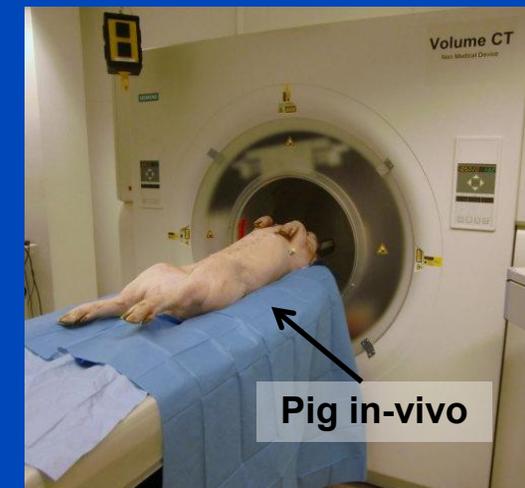

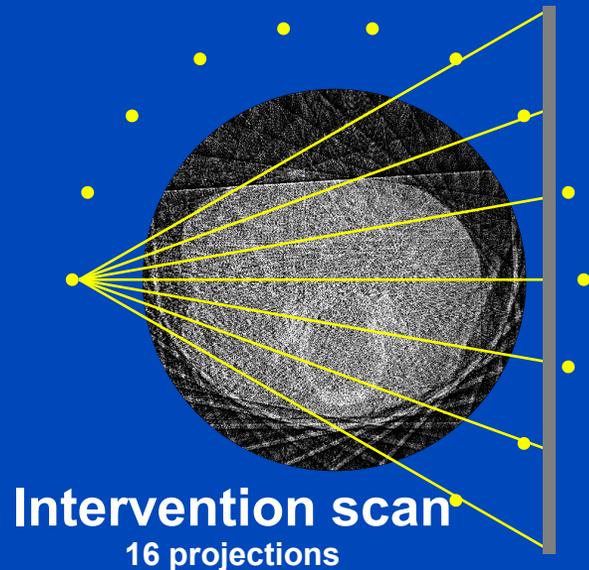

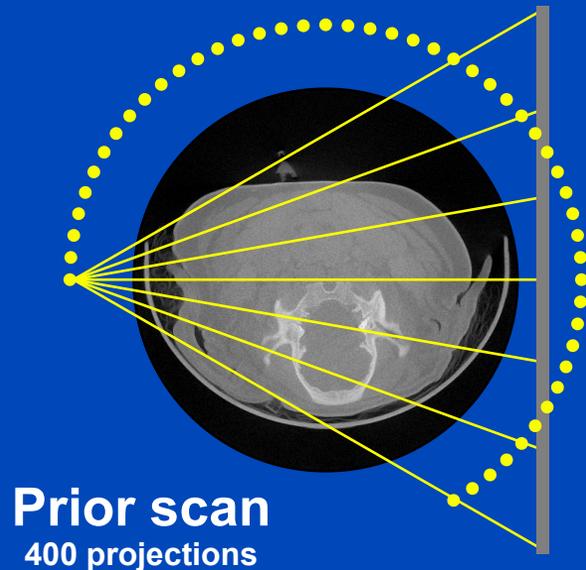

**3D+T  
tomographic  
fluoroscopy?  
At low dose?  
How???**

# How to Realize 3D+T Fluoroscopy

- Low dose by:
  - Low tube current
  - Very few projections (pulsed mode)
- Advantages of intervention guidance:
  - Repetitive scanning of the same body region: changes are **sparse**.
  - Interventional materials are fine structures (few voxels) of high contrast (metal).

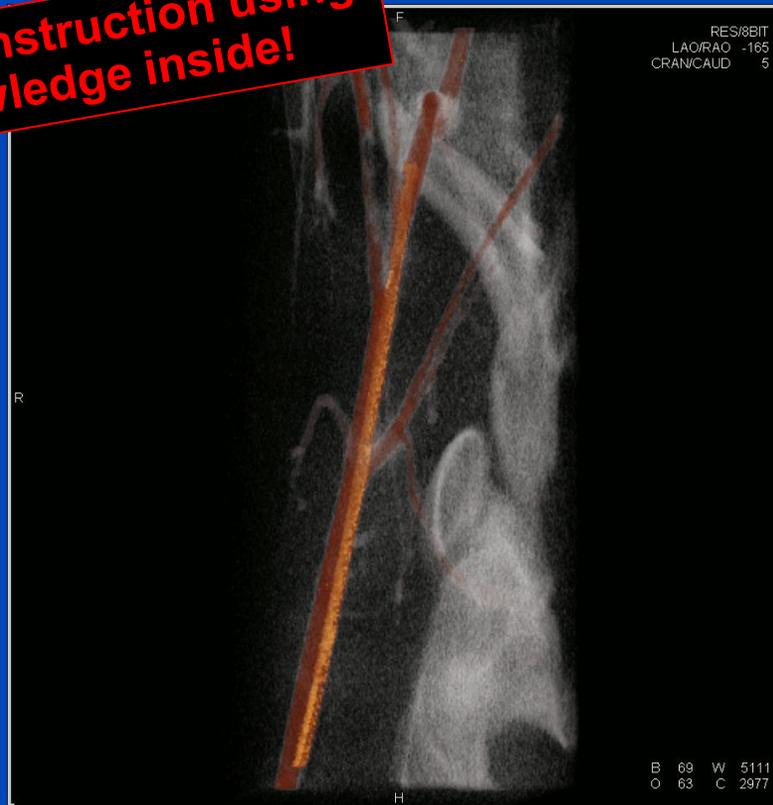

**Experimental setup**

# 3D+T Image Guidance at 2D+T Dose

## Stent Expansion in the Carotis of a Pig with Angio Roadmap Overlay

Iterative reconstruction using  
prior knowledge inside!

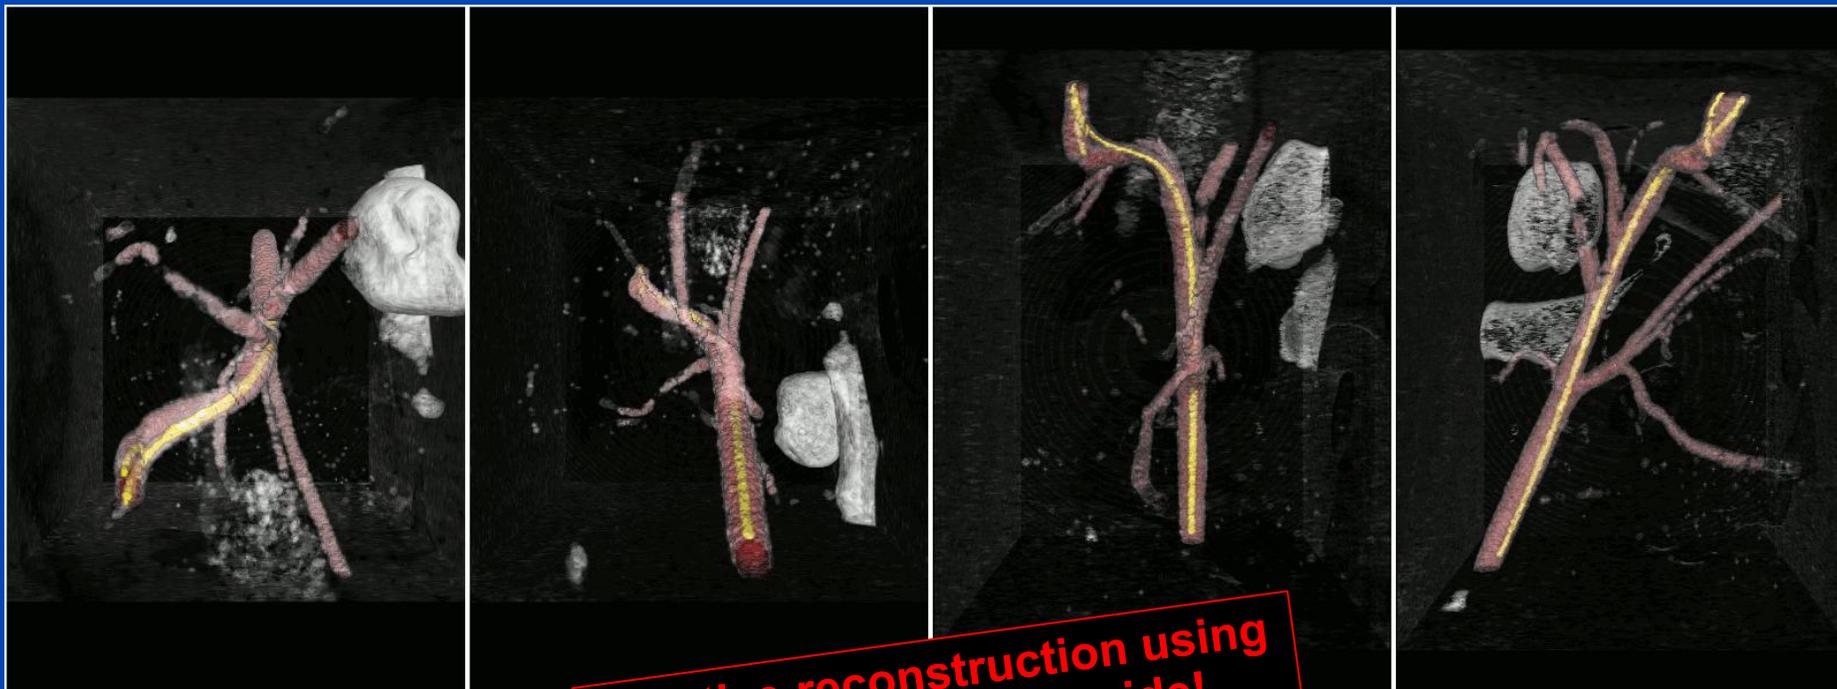

Dose of the yet unoptimized approach: 20 to 50  $\mu\text{Gy/s}$ .

This work was awarded the intervention award 2013 of the German Society of Neuroradiology (DGNR).  
This work was further selected as the Editor's Pick for the Medical Physics Scitation site.

# 3D+T Fluoroscopy at 2D+T Dose

Guide Wire in the Carotis of a Pig with Angio Roadmap Overlay

Iterative reconstruction using prior knowledge inside!

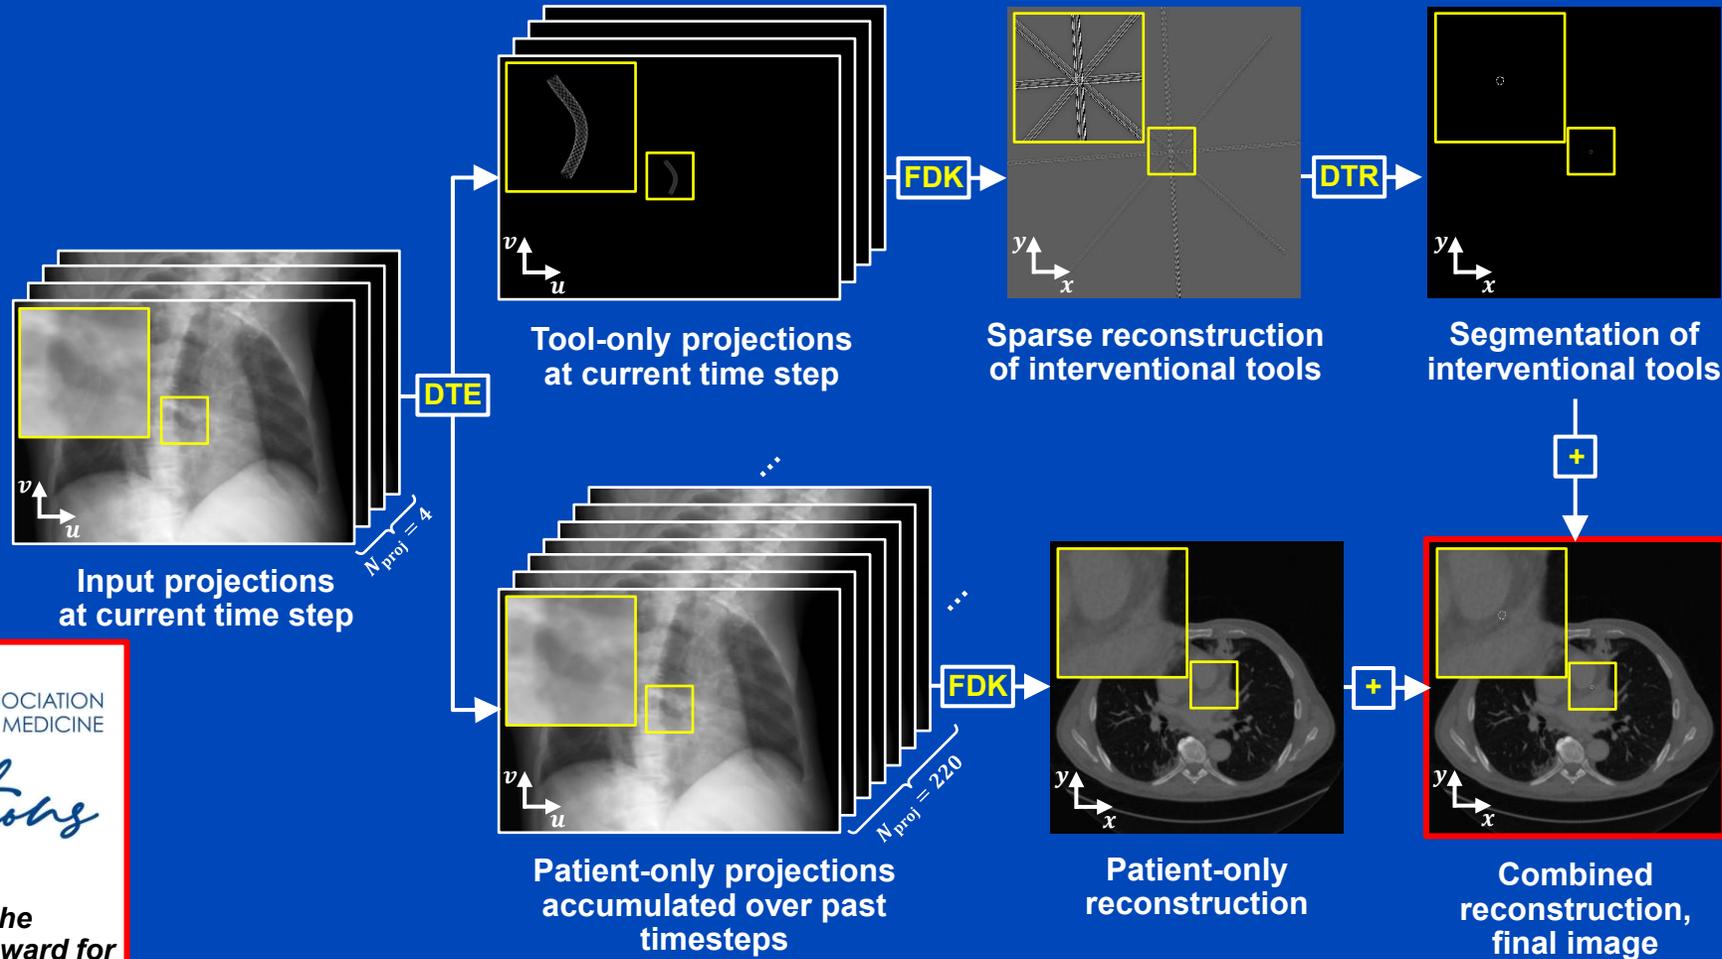

Dose of the yet unoptimized approach: 20 to 50  $\mu\text{Gy/s}$ .

Obviously, 16 projections are still too much.

Deep learning will help (5 years later)!

# Stop Motion Measurements

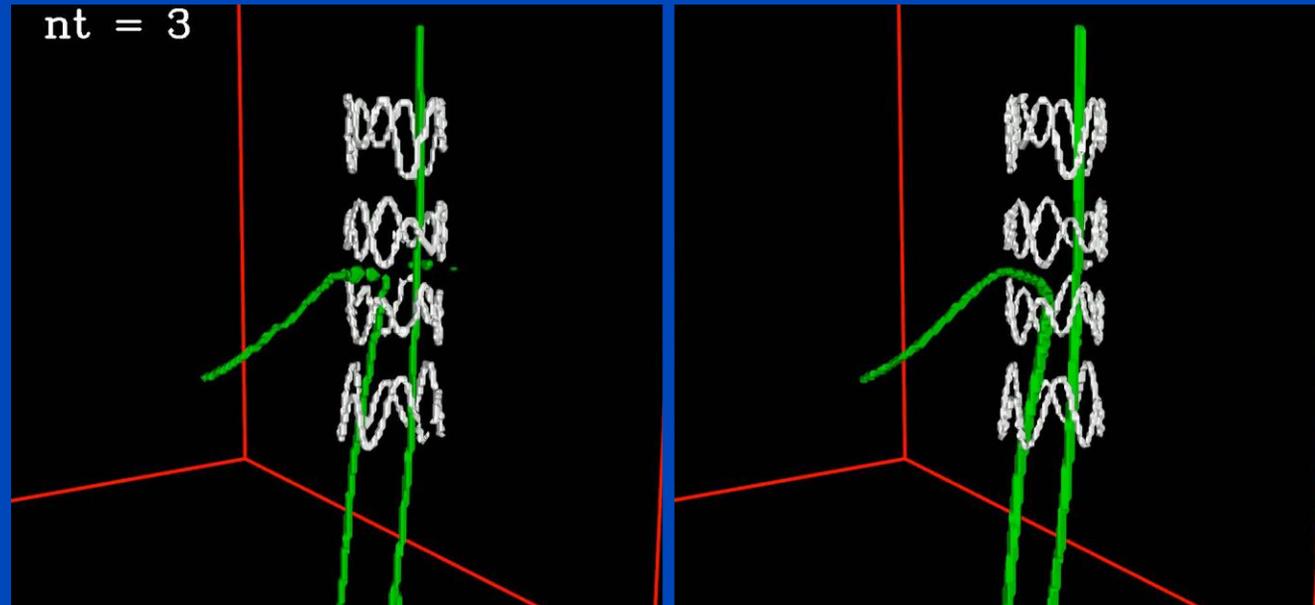

- Training: simulated data
- Results: stop motion measurements
- Flat detector
- For each time step  $t$ : 3D scan with fine angular sampling
- Choose two orthogonal projections from each 3D scan:
  - »  $t = 1$ :  $0^\circ, 90^\circ$
  - »  $t = 2$ :  $19^\circ, 109^\circ$
  - » ...
- Objects: anthropomorphic trunk phantom + extension + interventional material placed between phantom and extension
- Motion: sinusoidal motion of phantom in superior-inferior direction (mimicking respiratory motion) + pulling of guidewire
- Parameters used during stop-motion measurement:  
 $U = 100 \text{ kV}$ ,  $I = 30 \text{ mA}$ ,  $T_{\text{rot}} = 25 \text{ s}$ ,  $T_{\text{pulse}} = 20 \text{ ms}$
- Simulated parameters:  
 $U = 100 \text{ kV}$ ,  $I = 197 \text{ mA}$ ,  $T_{\text{rot}} = 3.8 \text{ s}$ ,  $T_{\text{pulse}} = 3 \text{ ms}$ ,  $\Delta t = 200 \text{ ms}$

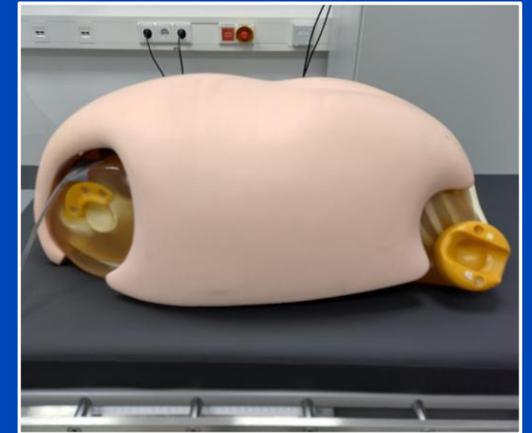

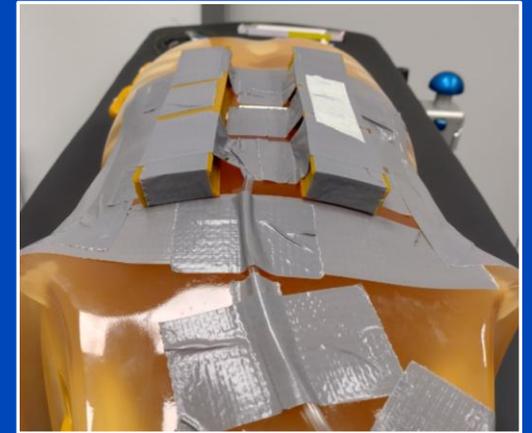

# Results

Reconstruction

Ground Truth

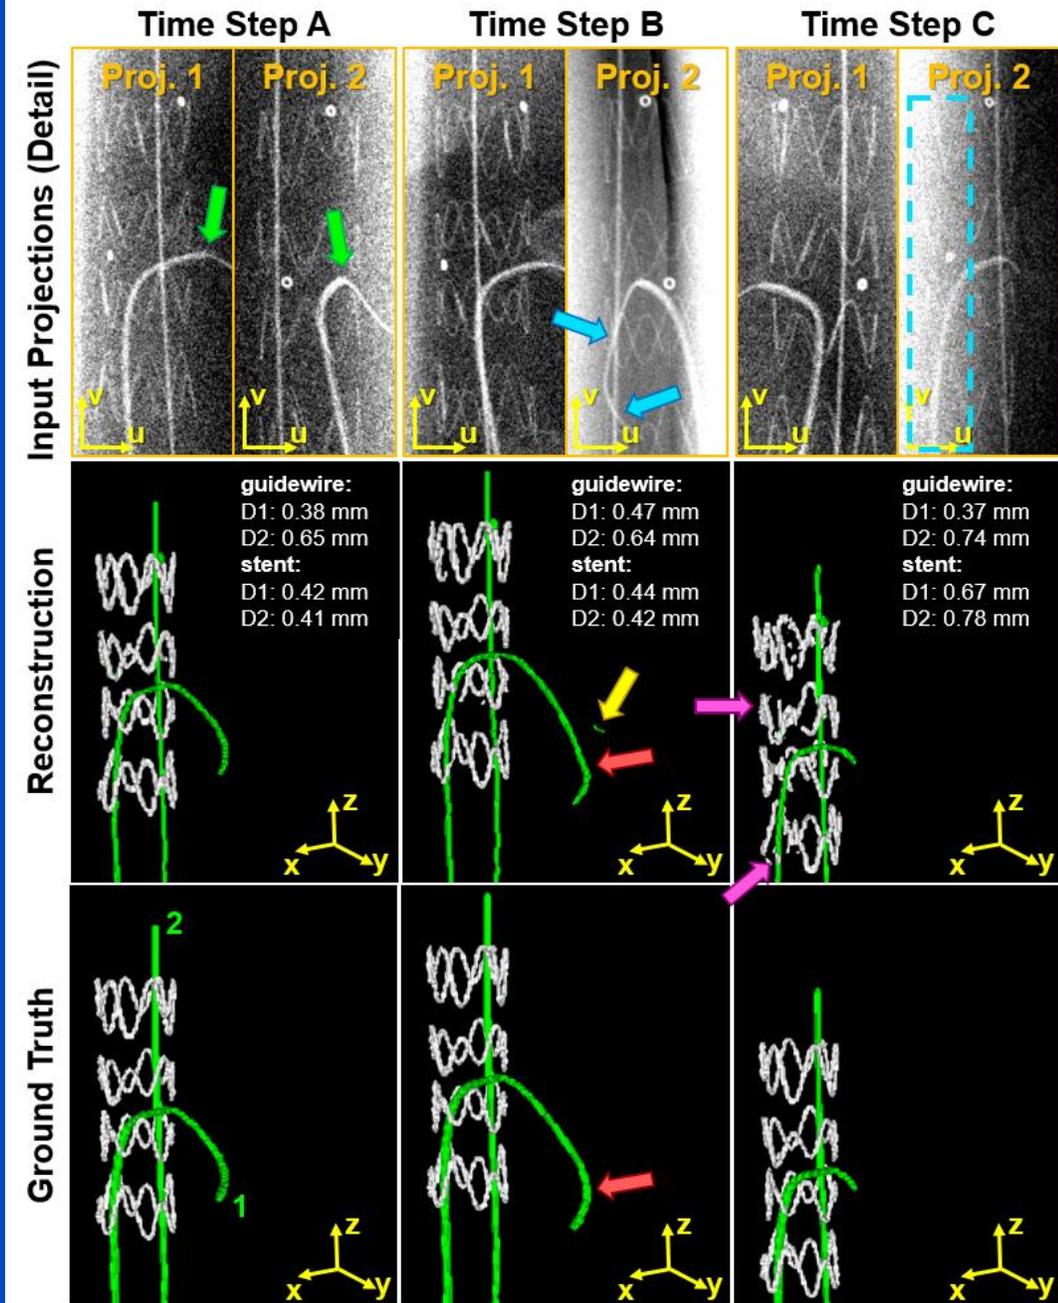

5 fps video of stop motion scan with 57 time steps.  
Sinusoidal 15 rpm motion of whole phantom with 11 mm amplitude.

Trunc phantom (with fat extension and interventional material) used for stop motion measurements.  
 $U = 100 \text{ kV}$ ,  $I = 30 \text{ mA}$ ,  $T_{\text{rot}} = 25 \text{ s}$ ,  $T_{\text{pulse}} = 20 \text{ ms}$

# Results

- **Figures of merit:**
  - $D_1$ : average distance between a skeleton of the ground truth and a skeleton of the reconstruction
  - $D_2$ : average distance between a skeleton of the reconstruction and a skeleton of the ground truth
- **Median over 57 time steps:**
  - **Guidewire:**  
 $D_1 = 0.37$  mm  
 $D_2 = 0.62$  mm
  - **Stent:**  
 $D_1 = 0.44$  mm  
 $D_2 = 0.44$  mm
